FRITZ!

FRITZ!Box 7369

Configuration and Operation

Table of Contents

Safety Instructions

Before connecting and starting operation of the FRITZ!Box 7369, observe the following security instructions in order to protect yourself and the FRITZ!Box from harm.

General Security Information

- The FRITZ!Box has no on/off switch. Therefore it must always be possible to disconnect the FRITZ!Box from the power supply.

    – Insert the power supply unit of the FRITZ!Box into an electrical outlet that is easy to reach.

- Overloaded outlets, extension cords and power strips can lead to fires or electric shocks.

    – Avoid using socket strips and extension cords if at all possible.

    – Do not connect multiple extension cords or socket strips to each other.

- Damage to electric wiring or gas or water pipes during drilling can present a significant danger.

    – Before mounting the FRITZ!Box on the wall, make sure that there are no electrical lines, gas or water pipes located where you need to drill the holes. If necessary, check the site with a pipe detector or consult with qualified experts.

- Durch Wärmestau kann es zu einer Überhitzung der FRITZ!Box kommen. Dies kann zu Schäden an der FRITZ!Box führen.

    – Provide for sufficient air circulation around the FRITZ!Box.

    – Make sure that the ventilation slits on the FRITZ!Box housing are always unobstructed.

    – The FRITZ!Box should not be placed on a carpet or on upholstered furniture.

    – Do not cover the FRITZ!Box.

- The base of the FRITZ!Box can heat up during normal operation. This heat can cause damage to heat-sensitive surfaces.

  – Do not place the FRITZ!Box on heat-sensitive surfaces.

- During electrical storms, lightning and electrical surges present a danger to connected electrical devices.

  – Do not install the FRITZ!Box during an electrical storm.

  – During a storm, disconnect the FRITZ!Box from the power supply and from the DSL or VDSL line.

- Moisture and liquids that find their way into the FRITZ!Box can cause electric shocks or short circuits.

  – Only use the FRITZ!Box indoors.

  – Never let liquids get inside the FRITZ!Box.

- The FRITZ!Box contains hazardous components and should only be opened by authorized repair technicians.

  – Do not open the FRITZ!Box housing.

  – If the FRITZ!Box needs to be repaired, please take it to a specialized vendor.

- Dust, moisture and vapors as well as caustic cleaners or solvents can damage the FRITZ!Box.

  – Protect the FRITZ!Box from dust, moisture and fumes.

  – Remove the FRITZ!Box from the mains before cleaning.

  – Clean the FRITZ!Box with a slightly moist, lint-free cloth.

Information on Interference

Radio interference can be generated by every device that emits electromagnetic signals. With so many radio waves from transmitting and receiving devices, interference can occur when radio waves overlap.

- Do not use the FRITZ!Box in areas where the use of radio devices is prohibited. Obey any relevant warning signs and instructions from authorized persons.

- Follow any instructions to switch off radio devices in hospitals, outpatient treatment centers, medical practices or similar facilities. These requests are issued to protect sensitive medical equipment from potential interference. Install and operate your FRITZ!Box at a sufficient distance, and avoid areas in which the use of radio equipment is prohibited.

- Consult your doctor and the manufacturer about whether any medical devices (pacemaker, hearing aid, electronically controlled implants, etc.) could be affected by interference from your FRITZ!Box. The manufacturers of pacemakers recommend maintaining a distance of at least 15 cm in order to avoid potential interference with the pacemaker.

Security Information on Electromagnetic Fields

The FRITZ!Box receives and transmits radio waves during operation. The FRITZ!Box was designed and constructed to comply with the threshold values for the exposition of radio waves recommended by the International Commission on Non-ionizing Radiation Protection (ICNIRP).

This directive was formulated by independent scientific organizations after regular and careful evaluation of scientific studies. It includes a large safety margin in order to ensure the safety of all persons, regardless of their age and health. For devices mounted in a fixed position that have their own power connection, like the FRITZ!Box, compliance with the minimum distance of 20 cm defined in the ICNIRP guideline has been certified (the measurements were conducted in accordance with the European EN 50385 standard).

If the minimum distance of 20 cm is not complied with, the threshold values of the corresponding directive may be exceeded.

Security Instructions for Operation of the FRITZ!Box in Potentially Explosive Environments

Under unfavorable conditions, radio waves can cause fires or explosions in explosive environments.

- Do not install and operate your FRITZ!Box in the vicinity of flammable gases and explosive environments like refueling areas, below-deck areas of ships, transport and storage facilities for fuels or chemicals, or paintshops, or areas in which the air contains chemicals or particles like grain, dust or metal powder.

- In areas with potentially explosive atmospheres, obey all instructions to switch off high-frequency devices.

- Do not install and operate your FRITZ!Box in the vicinity of blasting sites.

- In the vicinity of blasting sites, obey all instructions and signs directing you to "switch off radio sets" or "electronic devices" in order to prevent potential disturbance to demolition and ignition systems.

Conventions in the Manual

This manual uses the following symbols and emphases:

This symbol marks useful hints and tips.

This symbol indicates important instructions that must be observed to avoid malfunctions.

- Quotation marks designate elements and features in the user interface and paths.

  Example

  Select "System / Push Service" and click "Sender".

- Pointed brackets mark wild cards.

  Example

  To edit the device called ‹Name›, click the "Edit" button.

- Bold type in the text emphasizes important words.

  Example

  Do **not** leave the page without saving.

- Blue font in the text designates links and references within this manual and addresses to be entered in the browser.

  Example

  See also the information on page 12.

1   The FRITZ!Box 7369

Welcome! We are pleased you decided on a FRITZ!Box. The FRITZ!Box 7369 is the hub of your home network, connecting your computers and network devices with the Internet. You can operate the FRITZ!Box as an Internet router on a DSL or VDSL line.

The FRITZ!Box is equipped with ports for computers, telephones and USB devices and supports the wireless technologies wireless LAN (WiFi) and DECT. You can use the FRITZ!Box as a wireless LAN access point for wireless devices like notebooks, tablets or smartphones and as a DECT base station for your cordless telephones.

A connected telephone uses the FRITZ!Box as a PBX.

The FRITZ!Box integrates connected computers and network devices into your private home network. The devices can exchange data with each other and enjoy shared access to USB hard drives, USB printers and other USB devices. The FRITZ!Box transmits music, video and image files to suitable playback devices in the home network.

You can expand the scope of functions of your FRITZ!Box with AVM smart home devices for home automation.

Settings for the FRITZ!Box and for your private network are configured in an easy-to-use user interface. The user interface can be opened in any web browser. Wizards guide you step by step through the setup of the most important FRITZ!Box functions, and comprehensive Help is available on all functions.

This manual assists you in connecting, configuring and operating your FRITZ!Box. Its purpose is not only to introduce to you the many functions of the FRITZ!Box, but also to familiarize you with some of the technical context.

2 Ports, Interfaces, Buttons and LEDs

This chapter describes the ports, interfaces, buttons and LEDs of the FRITZ!Box.

2.1 Ports and Interfaces
Possibilities for connecting the FRITZ!Box

- **DSL 1**

  Socket for connecting to the VDSL2 bonding connector with a second DSL cable

- **DSL 2**

  Socket for connecting to the ADSL, ADSL2+ or VDSL2 line

- **PSTN**

  Socket for connecting to the analog landline

- **Phone**

  One RJ11 socket for one analog telephone or another analog terminal device

- **LAN 1 – LAN 4**

  4 gigabit Ethernet ports (10/100/1000 Base-T) for connecting computers and other network devices like game consoles and network hubs

- **USB/eSATA** ⛐

  2 USB 2.0 ports for connecting USB devices like printers or storage media

  The USB/eSATA port also supports the SATA (Serial Advanced Technology Attachment) standard

- **Wireless access point**

  Integrated wireless access point for connecting to wireless LAN devices that use the radio standard IEEE 802.11b, IEEE 802.11g or IEEE 802.11n in the 2.4-GHz frequency band

- **DECT base station**

  integrated DECT base station that supports the DECT-ULE standard. Up to 6 cordless telephones that use the DECT radio standard can be connected, as well as up to 10 FRITZ!DECT smart plugs.

2.2   Button

The FRITZ!Box has the following buttons:
FRITZ!Box buttons

Button Functions

"WLAN" Button

- Switches wireless LAN on and off

- Establishes a wireless LAN connection using WPS, see Establishing a Wireless LAN Connection Using WPS from page 31

"DECT" Button

- Registers cordless telephones, see page 55

- Pages cordless telephones, see page 120

Locking the Buttons on the FRITZ!Box

You can lock the buttons on the FRITZ!Box. Locking the buttons prevents the settings for your FRITZ!Box or your home network from being changed unintentionally or without authorization.

Example

With the "WLAN" button the wireless network of the FRITZ!Box can be switched off at the touch of a button. If this happens by accident, in some cases it may take some time before the cause is found and the wireless LAN radio network can be restored to all FRITZ!Box users in the home network.

The button lock is configured in the FRITZ!Box user interface, under "System / Buttons and LEDs" on the "Keylock" tab.

2.3 LEDs

The FRITZ!Box 7369 has five LEDs, which flash or light up to display various connection statuses and events.

For the "Info" LED you can assign any event desired in addition to the preset events. For more information, read Assigning Any Event to the "Info" LED on page 18.

Meaning of the LEDs

LED	Condition	Meaning
Power / DSL	on	Device has electrical power and the DSL line is ready for operation
	flashing	Device has electrical power and the connection to DSL is being established or has been interrupted
Internet	on	Telephone connection to the Internet is active
	flashing	Messages in your voice mail or inbox This function must be supported by your telephony provider
Fixed Line	on	Telephone connection to the landline network active
	flashing	Messages in your voice mail or inbox This function must be supported by your telephony provider
WLAN	on	Wireless LAN is enabled
	flashing	• Switching wireless LAN function on or off • Applying changes to the wireless LAN settings • Performing WPS • WPS procedure aborted: More than two wireless LAN devices are performing WPS at the same time. Repeat the WPS procedure.

LED	Condition	Meaning
Info	glows green	• Stick & Surf procedure with FRITZ!WLAN USB Stick from AVM concluded
		• Signals an event specified in the user interface under "System / Buttons and LEDs / Info Display".
	flashing green	• Updating FRITZ!OS
		• Stick & Surf procedure with FRITZ!WLAN USB Stick from AVM in progress
		• Registration procedure for a DECT handset in progress
		• Signals an event specified in the user interface under "System / Buttons and LEDs / Info Display".
	lights or flashes red	Error:
		• Open the FRITZ!Box user interface.
		• Follow the instructions on the "Overview" page in the user interface

Assigning Any Event to the "Info" LED

The "Info" LED signals various events. Some events for which the "Info" LED flashes or lights up are preset. You can also assign to the LED any additional event you like.

1. Open the FRITZ!Box user interface.

2. Under "System/Buttons and LEDs", click the "Info Display" tab.

3. In the "Freely Selectable Options" area, select an event from the ""Info" LED".

4. Click the "Apply" button.

The "Info" LED now flashes or lights up not only for the preset events, but also for the event you selected.

3   Before You Connect the FRITZ!Box

- Read the security instructions on page 8.

- Check the contents of your FRITZ!Box package. The contents are described on page 19.

- Make sure that the requirements for operating the FRITZ!Box have been met; see page 19.

- Read the handling instructions for your FRITZ!Box on page 21.

- Note the tips for passwords on page 21.

3.1   Contents of the FRITZ!Box Package

The FRITZ!Box 7369 is available in several different product variants, each of which is delivered with different components. See the FRITZ!Box 7369 box for details about what is included in your FRITZ!Box package.

- FRITZ!Box 7369

- one power supply unit

- one network cable

- two DSL cables

- one telephone cable

- one quick guide

3.2   Requirements for Operation

In order to operate the FRITZ!Box, you must have the following:

- an up-to-date web browser

    Some of the FRITZ!Box functions can be used only with a web browser that supports HTML5, for instance Firefox version 35 or higher, Internet Explorer version 10 or higher, or Google Chrome version 40 or higher.

- a connection to the Internet

    - DSL line with or without splitter: ADSL/ADSL2/ADSL2+ compliant with ITU G.992.1, ITU G.992.3 or ITU G.992.5 (Annex A, B J or M)

    - or two VDSL connections, ITU G.993.2 (VDSL2) standard that support link aggregation, for use with bonding

    - or an Internet cable access with cable modem

    - or a USB modem for mobile Internet access (UMTS/HSPA)

    - or another Internet connection

- for the wireless LAN connection to tablets, smartphones and computers:

    Tablets, smartphones or computers that support wireless LAN compliant with IEEE 802.11n, IEEE 802.11g or IEEE 802.11b. Computers that do not have wireless LAN integrated can be equipped with wireless LAN support by installing a wireless LAN device, like a FRITZ!WLAN USB Stick, for instance.

- for connecting computers using network cables:

    computer with a network port (network adapter standard Ethernet 10/100/1000 Base-T)

- for landline telephony:

    an analog telephone line

3.3 Handling the FRITZ!Box

- Read the Safety Instructions from page 8.

- You can place the FRITZ!Box on a horizontal surface or mount it on a wall. For a drilling template to mount the FRITZ!Box on a wall, see page 186.

- Place or hang the FRITZ!Box in a dry location that is free of dust and protected from direct sunlight.

- For ideal operating conditions, mount the FRITZ!Box on a wall with the cables connected on the bottom.

- When connecting the FRITZ!Box to your computer using a network cable, keep in mind that the cable can be no longer than 100 m.

- If you would like to establish wireless connections between the FRITZ!Box and the computer, position the FRITZ!Box at a central location.

- Make sure to keep sufficient distance from potential sources of interference like microwave devices or electric devices with large metal housings.

3.4 Tips for Passwords

Passwords are assigned at various places in the user interface to protect your settings and data in the FRITZ!Box. The FRITZ!Box assists you in assigning secure passwords, for instance when creating new users or configuring MyFRITZ!: A graphic display indicates how secure the password is. Note the following:

- Use a password rated as secure.

- Select a password with at least twelve characters, which includes capitals and lower-case letters as well as numerals and special characters.

- Under the search term "Characters for Passwords" the Help of the FRITZ!Box user interface contains more information about which characters you can use.

- Be sure to keep your passwords in a safe place!

- Configure the "Forgot password" push service. This notification service sends you an access link at regular intervals, with which you can access the FRITZ!Box user interface even if you have forgotten your password. See Push Services: Using Notification Services from page 153.

- If you lose your password for the user interface, you will have to restore the factory settings to the FRITZ!Box and, for reasons of security, reconfigure all of your personal settings for your Internet connection, your telephone system and your home network.

4 Connecting the FRITZ!Box

- Before you connect the FRITZ!Box, read the instructions on Safety Instructions from page 8.

- Connect the FRITZ!Box to the power supply.

- Connect the FRITZ!Box with your DSL or VDSL line.

- Connect the FRITZ!Box to your telephone line.

4.1 Connecting to Electrical Power
Connecting to the power supply

1. Pick up the power supply unit included in the FRITZ!Box package.

   Use only this power supply unit for connecting to electrical power.

2. Connect the power supply unit to the socket on the FRITZ!Box labeled "Power".

3. Plug the other end into an AC power outlet.

The "Power / DSL" LED begins flashing after a few seconds to indicate that the FRITZ!Box is ready for operation.

4.2 Connecting to the Internet

The FRITZ!Box can be connected using various types of Internet connections:

- on the DSL/VDSL line
- on the cable connection via a cable modem
- via mobile network
- on another router with Internet access

Connecting to the DSL or VDSL line
Connecting to the DSL splitter

1. Insert a DSL cable included into the "DSL 2" socket on the FRITZ!Box.

2. Insert the free end of the cable into a connecting jack on the DSL splitter.

3. If you have a VDSL2 bonding connection: Insert the second DSL cable into the "DSL 1" jack on the FRITZ!Box and into a connecting jack on the DSL splitter:
Connecting to the Splitter of an VDSL2 Bonding Connection

After a short time the "Power / DSL" LED on the FRITZ!Box lights up. The FRITZ!Box is ready to connect to the Internet.

Connecting to the Cable Junction

With an additional cable modem you can also use your FRITZ!Box 7369 on a cable connection. Use a network cable.

1. Connect the free end of the network cable to the LAN (Ethernet) port on the cable modem.

2. Connect the other end of the network cable to the socket on the FRITZ!Box labeled "LAN 1".

3. Connect a computer with the FRITZ!Box either via wireless LAN or using a network cable; see Connecting a Computer with a Network Cable from page 28 and Connecting Devices with the FRITZ!Box over Wireless LAN from page 31.

4. Set up the Internet connection for connections via cable in the FRITZ!Box; see page 51.

Connecting to the Internet via the Mobile Network

The FRITZ!Box can also connect to the Internet via the mobile communications network. A mobile telephone and a SIM card from a mobile communications network provider are required for this. The following kinds of connections and mobile communications standards are supported:

- LTE/UMTS/HSPA: The FRITZ!Box supports USB mobile communications dongles for LTE/UMTS/HSPA.

- USB tethering: The FRITZ!Box supports USB tethering. Mobile communications dongles and smartphones that support USB tethering can be used to connect to the Internet via the mobile communications network.

Using a Mobile Communications Dongle

1. Insert the mobile communications dongle into the USB port on the FRITZ!Box.

2. Configure the Internet connection via the mobile communications network; see page 51.

Using a Smartphone with USB Tethering

1. Use a USB cable to connect the smartphone with the FRITZ!Box.

2. Configure the Internet connection via the mobile communications network; see page 51.

Connecting to a Router or a Network

You can use the FRITZ!Box at an already existing Internet access. To do this the FRITZ!Box is connected to the router or network.

A network cable is required to connect the FRITZ!Box to a router.

1. Insert one end of the cable into the socket on the FRITZ!Box labeled "LAN 1".

2. Insert the other end of the cable into a network socket on the router or in the network.

Once you have connected a computer to the FRITZ!Box, you can configure the Internet connection, see Internet Connection over : FRITZ!Box as a Router on page 52.

4.3   Connecting to the Landline

You can connect the FRITZ!Box with an analog telephone line.

An analog telephone line is a landline with one telephone number.

Connecting the FRITZ!Box
1.   Insert one end of the telephone cable into the socket on the FRITZ!Box labeled "PSTN".

2.   Insert the other end of the cable into the telephone socket on your DSL splitter.

The FRITZ!Box is connected with the analog telephone line.

5 Connecting a Computer with a Network Cable

You can connect computers and other network devices with the FRITZ!Box using a network cable.

5.1 Connect the Computer

One computer or other network device can be connected to each LAN port of the FRITZ!Box.
Connecting a computer using a network cable

1. Insert the network cable included in the package into the LAN port of the computer.

   You can also use any other network cable. For more information, see page 178.

2. Insert the free end of the cable into a LAN socket on the FRITZ!Box.

Now the FRITZ!Box and the computer are connected with each other.

5.2   Connecting a Network Hub or Switch

You can connect a network hub or network switch to the FRITZ!Box.
1.   Insert the network cable included in the package into the uplink port of the network hub or network switch.

You can also use any other network cable. For more information, see page 178.

2.   Insert the free end of the cable into a LAN socket on the FRITZ!Box.

The FRITZ!Box and the network hub are now connected with each other.

5.3   Saving Energy at the LAN Ports

For energy-efficient use of your gigabit LAN ports you can specify for each individual LAN port whether it should always operate with full power (power mode) or with reduced energy consumption (green mode). With green mode you can reduce the power consumption of the FRITZ!Box to the level necessary for your applications.

The LAN ports can be configured in the advanced view of the FRITZ!Box user interface; see page 37.

Under "Home Network / Network / Network Settings" you can select from among the following operating modes in the "LAN Settings" area:

Operating Mode	Functionality and Power Consumption
Power Mode	In this setting LAN connections are established with a maximum transmission rate of 1 Mbit/s. Higher power consumption than in green mode if the LAN port is used.
Green Mode	As needed, the FRITZ!Box establishes LAN connections with a transmission rate of 100 Mbit/s. Lower power consumption than for the "Power Mode" setting.

6 Connecting Devices with the FRITZ!Box over Wireless LAN

Computers and other devices with wireless LAN, for instance smartphones and network printers, can be connected wirelessly with the FRITZ!Box.

You can establish the wireless LAN connection using WPS or by entering the FRITZ!Box network key on the wireless device.

Mobile devices with a camera, like smartphones or tablets, can scan the QR code of the network key to establish a wireless LAN connection.

6.1 Establishing a Wireless LAN Connection Using WPS

WPS is a procedure for establishing secure wireless LAN connections. With WPS, connecting a wireless device with the FRITZ!Box is quick and easy.

Requirements

The wireless device must support WPS.
Establishing a Connection on a Windows Computer Using WPS

Here is how to establish a wireless connection with WPS on a computer with Windows 10, 8, or 7:

1. If the "WLAN" LED on the FRITZ!Box is off, press the "WLAN" button briefly.

   The wireless radio network of the FRITZ!Box will be switched on.

2. Open the wireless LAN software on the computer.

   In Windows 10 and 8, for instance, click the wireless LAN icon 📶 📶 in the task bar.

3. Select the wireless radio network of the FRITZ!Box.

   The preconfigured name of the wireless radio network (SSID) is "FRITZ!Box 7369".

4. Click "OK".

    The field for the network key appears, along with the in-
    formation that you can establish the connection by
    pressing a button on the router:
5. For this step you have two minutes: Press the "WLAN"
    button on the FRITZ!Box and hold it down until the
    "WLAN" LED begins flashing.
    The wireless LAN connection will be established.

Connecting on Other Wireless Devices Using WPS

Here is how to establish a wireless connection with WPS on a
wireless LAN device without Windows:

1. If the "WLAN" LED on the FRITZ!Box is off, press the
    "WLAN" button briefly.

    The wireless radio network of the FRITZ!Box will be
    switched on.

2. Use your wireless device to search for wireless networks
    in the vicinity.

    See the documentation of the wireless LAN device for in-
    structions on how to do this.

3. Select the wireless radio network of the FRITZ!Box and start connecting with WPS.

4. For this step you have two minutes: Press the "WLAN" button on the FRITZ!Box and hold it down until the "WLAN" LED begins flashing.
The wireless LAN connection will be established.

6.2   Entering the Network Key on the Wireless Device

You can establish a wireless LAN connection by entering the FRITZ!Box network key on the wireless device.

The preset network key is printed on the bottom on the FRITZ!Box. A new network key can be entered in the user interface.

1. If the "WLAN" LED on the FRITZ!Box is off, press the "WLAN" button briefly.

    The wireless radio network will be switched on.

2. Open the wireless LAN software on your wireless device. In Windows 10 and 8, do this by clicking the wireless LAN icon   in the task bar.

3. Select the wireless radio network of the FRITZ!Box.

    The preconfigured name of the wireless radio network (SSID) is "FRITZ!Box 7369".

4. Click "OK".

5. Enter the network key of the FRITZ!Box in the wireless LAN software.

6. Start the connection procedure.

6.3 Connecting to Mobile Devices Wirelessly Using the QR Code

With mobile devices that have a camera and a QR code reader (app), like smartphones and tablets, you can connect wirelessly by scaning a QR code.

1. Open the FRITZ!Box user interface.

2. Select "Wireless (WLAN) / Radio Network".

3. Scan the QR code with your mobile device's QR code reader, directly from the monitor of from a printout.

The mobile device automatically establishes a secure wireless connection to the FRITZ!Box.

7 The FRITZ!Box User Interface

The FRITZ!Box has a user interface you can open in a web browser on your computer or on mobile devices like a table or smartphone.

In the user interface you can configure the FRITZ!Box, enable or disable functions and receive information on the FRITZ!Box and on your connections.

7.1 Opening the User Interface

The FRITZ!Box user interface can be opened on any computer, tablet or smartphone connected with the FRITZ!Box.

1. Start a web browser on your computer.

2. Enter http://fritz.box in the address field of your web browser.

The FRITZ!Box user interface opens.

The first time the user interface is opened, the Wizard for Opening the Basic Configuration. To protect your private data, settings and account information, the wizard starts with the assignment of a password for access to the user interface.

3. Enter a FRITZ!Box password and click "OK".

If the user interface is not opened, read the information start-ing from page 169.

7.2 Overview: FRITZ!Box at a Glance

All important information about the FRITZ!Box is displayed under "Overview" in the FRITZ!Box user interface.

By clicking the linked entries or "more..." you can jump from the Overview to the corresponding menus and configure set-tings there.
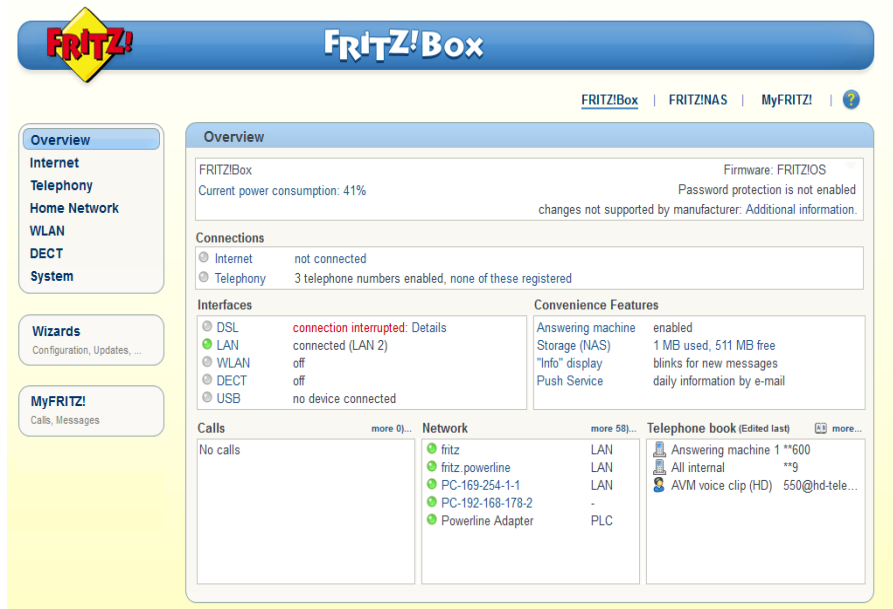

The "Overview" page of the FRITZ!Box

The name of your FRITZ!Box model is displayed in the header of the FRITZ!Box user interface. Next to it are the links to the FRITZ!Box areas FRITZ!NAS and MyFRITZ!.

Under the title line containing the name of the given menu is displayed, once again, the name of your FRITZ!Box model, the FRITZ!OS version currently installed, and the current energy consumption. This area also displays any important notifications for secure, reliable operation of the .FRITZ!Box

Depending on your settings, the following information is displayed here:

- the name you assigned for your FRITZ!Box; see

- the availability of a new FRITZ!OS version for your FRITZ!Box; see .

The upper area of the window presents information about connections and interfaces.

The **lower** area of the window presents the last calls made, any answering machine messages received, the devices connected in the home network and the enabled convenience features.

7.3   Standard View and Advanced View

The FRITZ!Box user interface has two views: the standard view and the advanced view.

Enable the advanced view in the "Internet" and "Home Network" areas only if you have advanced network expertise. Incorrect combinations of settings in these areas can produce a situation in which the FRITZ!Box user interface can no longer be opened.

Upon delivery, the FRITZ!Box interface is set to display the standard view. In the standard view all of the settings required for daily operation of the FRITZ!Box are at your disposal. Some pages and areas of the FRITZ!Box user interface are not displayed.

In the advanced view additional settings options appear under various menus and commands. The expanded menu items contain settings for advanced users and are not required for daily FRITZ!Box operation.

Fast Switching between the Views

The "View" link below the menu of the FRITZ!Box allows you to switch instantly between the standard view and the advanced view:

The "View" link in the user interface

7.4   Assigning FRITZ!Box a Name

You can assign an individual name for your FRITZ!Box in the FRITZ!Box user interface. The name is set up under **"Home Network / FRITZ!Box Name"** and appears in the following areas of your home network display:

- name of the wireless radio network (SSID)

- name of the guest radio network (SSID)

- name of the working group released for home network sharing

- name of the media server

- individualized FRITZ!Box name for MyFRITZ!

- name of the DECT base station

- Push service sender name

8 Password Protection: Using FRITZ!Box Safely

Your FRITZ!Box contains many personalized settings for your home network, your telephone system and your Internet connection. For this reason we recommend protecting access to the user interface of your FRITZ!Box with a password.

8.1 Overview

The FRITZ!Box offers two ways to configure password protection:

Property	FRITZ!Box password	FRITZ!Box user
Password	You specify a password. Everyone who knows the password can access the FRITZ!Box user interface.	There are user accounts. Every FRITZ!Box user receives her or his own password for opening the user interface.
Scope of access	With the FRITZ!Box password, access to all contents and settings in the FRITZ!Box is permitted.	For each FRITZ!Box user, you define which contents and settings of the FRITZ!Box the given user is allowed to access.
Kind of access	Login to the user interface is permitted from devices located in the home network of the FRITZ!Box.	A FRITZ!Box user can also log in to the FRITZ!Box user interface—with the appropriate user rights—from the Internet.

8.2 Setting a FRITZ!Box Password

Overview

The basic method of logging in to the FRITZ!Box user interface is to enter the FRITZ!Box password. With this password all users can open the user interface and access all of the FRITZ!Box's contents and settings.

With the FRITZ!Box password it is not possible to access the FRITZ!Box from the Internet, however. In such a case you also require an account as a FRITZ!Box user; see Creating FRITZ!Box Users from .

Rules

When setting passwords, comply with the following rules:

- Use a password rated as secure.

- Select a password with at least twelve characters, which includes capitals and lower-case letters as well as numerals and special characters.

- Be sure to keep your passwords in a safe place!

- Use the "Forgot password" push service. When you have forgotten a password, the FRITZ!Box sends you an access link to the e-mail address you specified. You can assign a new password using this link.

If you lose your FRITZ!Box password, you will have to restore the factory settings to the FRITZ!Box and you will have to re-configure all of your personal settings for your Internet connection, your telephone system and your home network.

Configuring the FRITZ!Box Password

1. Open the FRITZ!Box user interface.

2. Select "System / FRITZ!Box Users / Login to Home Network".

3. Select the option "Login with the FRITZ!Box password".

4. Enter a password.

5. Click "Apply".

   You will be directed to the welcome screen of your FRITZ!Box.

6. Enter your password to log in to the user interface of your FRITZ!Box.

Configuring a Password

1. Open the FRITZ!Box user interface.

2. Select "System / FRITZ!Box Users / Login to Home Network".

3. Select the option "Login with the FRITZ!Box password".

4. Enter a password.

   For more information on the characters you can use for the password, see the Help on the FRITZ!Box user interface.

5. Click "Apply".

   You will be directed to the welcome screen of your FRITZ!Box.

6. Enter your user name to log in to the user interface of your FRITZ!Box.

With the FRITZ!Box password it is not possible to access the FRITZ!Box from the Internet. For users who require access to the FRITZ!Box via Internet, you must also set up an account as a FRITZ!Box user; .

Quick Access: Logging Off and Changing the Password

If you are logged in with the FRITZ!Box password, the upper navigation bar will display the entry "Logged in":
Here you can change the FRITZ!Box password and log off the user interface. Log off before you surf the web with your browser. If you do not click on the user interface for a period of longer than 60 minutes, you will be logged off automatically.

8.3 Creating FRITZ!Box Users

Overview

You can set up as many as 18 user accounts in the FRITZ!Box. A FRITZ!Box user opens the user interface of the FRITZ!Box by entering her or his personal password. There she or he can view and change those contents or settings for which she or he has been granted access rights.

It is up to you whether to use FRITZ!Box users instead of the FRITZ!Box password. You need password-protected login with the FRITZ!Box account in the following cases:

- You would like to access your FRITZ!Box from the Internet.

- You would like to assign different rights to different users.

Rules

When setting passwords, comply with the following rules:

- Use a password rated as secure.

- Select a password with at least twelve characters, which includes capitals and lower-case letters as well as numerals and special characters.

- Be sure to keep your passwords in a safe place!

- Use the "Forgot password" push service. When you have forgotten a password, the FRITZ!Box sends you an access link to the e-mail address you specified. You can assign a new password using this link.

Configuring Users

First you must set up at least one FRITZ!Box user with the right "FRITZ!Box Settings". Then you can configure more users.

You can configure up to 18 user accounts.

Configuring Users with the "FRITZ!Box Settings" Right

1. Open the FRITZ!Box user interface.

2. Select "System / FRITZ!Box Users / User".

3. Click the "Add User" button.

4. Enter a user name, a valid e-mail address and a password for the new user.

    For more information on the characters you can use for the password, see the Help on the FRITZ!Box user interface.

5. Specify whether or not the new FRITZ!Box user is allowed to access from the Internet the FRITZ!Box contents for which she or he has access rights.

    Keep in mind that in order to access the FRITZ!Box from the Internet, a corresponding service must also be enabled in the FRITZ!Box. For information on how to do this, see the section Accessing the FRITZ!Box from the Internet from page 46.

6. In the "Rights" area, specify which contents each FRITZ!Box user is allowed to use.

    For a user to be able to configure settings on the FRITZ!Box, the user must have at least the "FRITZ!Box Settings" right.

    For more information on rights, see the section from page 45.

7. Save your entries by clicking "OK".

    The FRITZ!Box user account has been configured.

    If you would like to use user accounts to log into the FRITZ!Box from the home network as well, also perform the following two steps:

8. Switch to the "Login to the Home Network" tab. Select the option "Login with FRITZ!Box user name and password" and click "Apply".

   You will be directed to the welcome screen of your FRITZ!Box.

9. Select your user name and enter your password.

Now you can set up more users.

Setting Up More FRITZ!Box Users

1. Open the FRITZ!Box user interface.

2. Select "System / FRITZ!Box Users / Users".

   A list of the FRITZ!Box user accounts is displayed. The user accounts can be edited or deleted using the buttons [icon] or [icon] behind the list entries.

3. Click the "Add User" button.

4. Enter a user name, a valid e-mail address and a password for the new user.

   For more information on the characters you can use for the password, see the Help on the FRITZ!Box user interface.

5. Specify whether or not the new FRITZ!Box user is allowed to access from the Internet the FRITZ!Box contents for which she or he has access rights.

   Keep in mind that in order to access the Internet, a corresponding service must also be enabled in the FRITZ!Box. For information on how to do this, see the section Accessing the FRITZ!Box from the Internet from page 46.

6. In the "Rights" area, specify for each FRITZ!Box user which FRITZ!Box contents she or he is allowed to use.

   For more information on rights, see the section from page 45.

7. Click "OK".

The FRITZ!Box user account has been configured.

Do not create any user accounts for temporary users (like weekend guests, for example) whom you would like to grant Internet access over your FRITZ!Box temporarily. Use the guest access of the FRITZ!Box over wireless LAN instead; see page 145.

Rights for FRITZ!Box Users

The rights define which contents of the FRITZ!Box a FRITZ!Box user is allowed to access.

The rights checked in the user account are granted to the FRITZ!Box user for access from the home network and—if enabled—also for access from the Internet; see page 46.

You can grant the following rights:

- FRITZ!Box settings

  A user with these rights can open the http://fritz.box or http://myfritz.box view of the FRITZ!Box user interface. Here she or he can see and edit all settings. Configuration rights automatically include the right to access voice messages, faxes, FRITZ!App Fon and the call list as well as the right to control smart home devices.

  A registered user cannot revoke these rights herself or himself and cannot disable her or his own account.

- Voice messages, faxes, FRITZ!App Fon and call list

  A user with these rights can open the http://myfritz.box view. There she or he can view faxes, the call list, FRITZ!App Fon, and listen to voice messages.

- Smart home

  If you also deploy AVM devices for home automation in your FRITZ!Box network, a FRITZ!Box user with these rights can use the MyFRITZ! access for the remote control of up to 10 switchable outlets.

- VPN

  A user with this right can use her or his mobile device or computer to establish a safe VPN connection to the FRITZ!Box and its home network.

Accessing the FRITZ!Box from the Internet

Damit Sie über den MyFRITZ!-Dienst aus dem Internet auf Ihre FRITZ!Box zugreifen können, müssen die folgenden Voraussetzungen alle erfüllt sein:

- You have set up an account with the MyFRITZ! service; see page 148. Your FRITZ!Box is registered with this MyFRITZ! account.

- The option "Access from the Internet allowed" is enabled in your user account.

- The option "Internet access to the FRITZ!Box via HTTPS enabled" is checked in the "Internet / Permit Access / FRITZ!Box Services" menu, or in the "Internet / MyFRITZ!" menu.

  When the MyFRITZ! service is enabled this check mark is set automatically.

A FRITZ!Box user who has been granted Internet access can use the MyFRITZ! service (myfritz.net) to access the corresponding FRITZ!Box from any location. From the Internet this user can reach only those FRITZ!Box functions for which she or he is authorized.

Check at regular intervals whether a FRITZ!Box user still requires access to the FRITZ!Box from the Internet, and if not, disable this feature in the properties of the user. For security's sake we recommend disabling Internet access to the FRITZ!Box via HTTPS whenever no more FRITZ!Box users require access to the user interface of your FRITZ!Box from the Internet.

For more information about MyFRITZ!, see the chapter MyFRITZ!: Accessing the FRITZ!Box from Anywhere from page 148.

For more information about HTTPS, see the chapter Access from the Internet via HTTPS, FTP and FTPS from page 73.

Here Is How to Use Access from the Internet

- As a FRITZ!Box user with the "FRITZ!Box Settings" right you can view and edit the settings of your FRITZ!Box from anywhere.

- With the "VPN" right you can establish a VPN connection between your iOS or Android device and your FRITZ!Box over the Internet. This way you can integrate your smartphone or tablet in the home network and communicate with other devices in the network or use FRITZ!Box functions.

- If you set up a FRITZ!Box user account for every member of the family, with at least the rights to access voice messages, faxes, FRITZ!App Fon and the call list, the entire family can check the answering machine or view the call list even when they're away from home.

- As a FRITZ!Box user with the "Smart Home" right, you can switch your lamps or aquarium pumps on and off from anywhere in the world. The prerequisite is that you connect them to Smart Home devices from AVM (like FRITZ!DECT 200, for instance) which are integrated in the home network of your FRITZ!Box. You can remote control up to 10 switchable outlets over your MyFRITZ! access.

Quick Access to Your Own User Account

The upper navigation bar of the FRITZ!Box shows the name of the FRITZ!Box user account with which the user is currently logged in to the user interface.
Click the user name to control basic functions of this user account:

- **Change e-mail Address**

  Select the "Change e-mail Address" entry to assign a different e-mail address to the current user account.

- **Change the Password**

  With the "Change Password" entry you can change the password of the current user account.

- **Logging off**

  Click "Log Off" here to leave the FRITZ!Box user interface.

  Log off of the FRITZ!Box user interface before you surf the web with your browser. If you do not click on the FRITZ!Box user interface for a period of longer than sixty minutes, you will be logged off automatically.

Disabling FRITZ!Box Users

You can disable a user account without deleting it. The owner of a disabled account can no longer access the FRITZ!Box.

You can neither delete nor disable the user account with which you are currently logged in to the user interface of your FRITZ!Box.

1. In the user interface, open the "System / FRITZ!Box Users / User" menu.

2. Click the "Edit" button for the user account to be disabled.

3. Remove the checkmark in front of the "User account enabled" option.

4. Apply the change by clicking "OK".

The user account has been disabled.

8.4 Forgotten Password: What To Do

If you have forgotten your password for the user interface, for reasons of security, you have to restore the factory settings to your FRITZ!Box; see Deleting User Settings from page 166.

You can avoid this by enabling the "Forgot password" push service when you configure your FRITZ!Box; see the section Push Services: Using Notification Services from page 153.

8.5 "No login" Mode

From within the home network you can operate the FRITZ!Box user interface without enabling password protection. This means that every user who accesses the interface of your FRITZ!Box can view and change all information and settings.

In the "No login" mode, your private information is not sufficiently protected from malicious programs or unwelcome activities. Therefore we urgently advise against using the FRITZ!Box without password protection!

Protect your FRITZ!Box by defining a password for the FRITZ!Box user interface. To do this, go to the "System / FRITZ!Box Users / Login to the Home Network" menu and select one of the password protection methods.

For comprehensive information about logging in to the FRITZ!Box with a password, see the sections Creating FRITZ!Box Users from page 42 and Setting a FRITZ!Box Password from page 39.

9 Configuring an Internet Connection in the FRITZ!Box

Once you have connected the FRITZ!Box to your Internet connection, you must configure the Internet connection in the FRITZ!Box user interface so that the FRITZ!Box can establish the connection to your Internet service provider and connect to the Internet.

The sequence and number of steps required to configure your Internet connection depend on the kind of connection, the desired operating mode, and the Internet service provider.

9.1 Internet Connection for DSL

Enter the Internet account information you received from your DSL/Internet service provider. These data are required to configure the Internet connection.

Your Internet service provider also supplied information about the configuration of your Internet connection. Always perform the Internet connection setup as described by your provider.

Configuring Your Internet Connection Automatically

If your Internet service provider arranges for the service of automatically configuring your Internet connection, the automatic configuration will be performed right after the FRITZ!Box is connected. No additional settings for the Internet connection have to be configured in the FRITZ!Box. To start automatic configuration, some providers require that you enter a start code.

Configuring Your Internet Connection Using the Wizard

1. Open the FRITZ!Box user interface.

2. Select the "Wizards" entry in the menu.

3. Click the "Check Internet Connection" Wizard and follow the instructions.

When the Wizard is finished, your Internet connection has been configured.

Choose this method if the FRITZ!Box is connected to a DSL modem or a DSL router, or integrated into an existing network.

1. Open the FRITZ!Box user interface.

2. Switch to the advanced view; see page 37.

3. Select the "Internet / Account Information" menu and enter your account information.

4. Click "Apply" to save your entries.

In the Help of the FRITZ!Box user interface you can find detailed instructions.

9.2   Configure Internet Connection for Cable

With an additional cable modem you can also use your FRITZ!Box 7369 on a cable connection. The Internet connection then will be established and controlled by the FRITZ!Box. In this operating mode all FRITZ!Box functions (like Internet telephony, firewall) are available without restriction.

1. Open the FRITZ!Box user interface.

2. Select the "Wizards" entry in the menu.

3. Click the "Check Internet Connection" Wizard and follow the instructions.

9.3   Configuring the Internet Connection for a Mobile Network

The FRITZ!Box can also connect to the Internet via the mobile communications network; see also Connecting to the Internet via the Mobile Network on page 26. The FRITZ!Box supports the following devices and mobile communications standards:

- USB mobile communications dongles for LTE/UMTS/HSPA.

- Mobile communications dongles and smartphones that support USB tethering.

Mobile Communications Dongle or Smartphone on the USB Port

1. Insert the mobile communications dongle in the USB port of the FRITZ!Box or connect the smartphone with the FRITZ!Box using a USB cable.

2. Open the FRITZ!Box user interface.

3. Select the "Internet / Mobile Communications" menu.

    The "Mobile Communications" menu is not available until a mobile communications device is connected to the USB port on the FRITZ!Box.

4. Select the setting "Mobile connection enabled".

5. Configure the settings for your Internet connection over the mobile communications network. In the Help of the FRITZ!Box user interface you can find detailed instructions.

When the mobile communications function is used, the FRITZ!Box user interface presents information about network availability, connection status and throughput.

Due to technical limitations on the part of the mobile communications network providers, some limitations may arise for Internet telephone calls and for applications requiring an incoming connection. This is also true for using port sharing, releasing USB storage media for sharing, remote maintenance over HTTPS, Dynamic DNS and VPN. Contact your network provider for details on any restrictions that may apply.

9.4   Internet Connection over : FRITZ!Box as a Router

You can use the FRITZ!Box at an already existing Internet access via the "" socket. To do this the FRITZ!Box is connected to the router or network. For this kind of connection the FRITZ!Box can be configured as an independent router or as an IP client in the existing network.

Configuring FRITZ!Box as a Router

You can configure the FRITZ!Box to work as an independent router to provide a network with its own network address range.

1. Connect the FRITZ!Box to the router or network with a network cable; see Connecting to a Router or a Network on page 26.

2. Open the FRITZ!Box user interface.

3. Select the "Internet / Account Information" menu.

4. Select the "Existing connection over LAN" entry from the "Internet service provider" drop-down list.

5. Click "Apply".

The FRITZ!Box is configured as a router and the network range is changed automatically.

The FRITZ!Box, along with the network devices connected with it directly, forms its own self-contained network.

Configuring FRITZ!Box as an IP Client

You can configure the FRITZ!Box such that it is integrated into the existing network as an IP client and shares the existing Internet connection in the network.

1. Connect the FRITZ!Box to the router or network with a network cable; see Connecting to a Router or a Network on page 26.

2. Open the FRITZ!Box user interface.

3. Select the "Internet / Account Information" menu.

4. Select the "More Internet service providers" entry from the "Internet service provider" drop-down list.

5. Select the "Other Internet service provider" entry from the second drop-down list.

6. From the "Connect via" area, select the "External modem or router" option.

7. In the "Operating Mode" area, select the setting "Share existing Internet connection in the network (IP client mode)".

The FRITZ!Box is integrated into the existing network as an IP client. The FRITZ!Box and the connected network devices receive an IP address from the IP address range of the existing network. The FRITZ!Box and the connected network devices are thus part of this network.

10 Connecting Telephones and Other Terminal Devices

This chapter describes how to connect telephones, fax machines, answering machines and telephone systems (PBXs) to the FRITZ!Box.

10.1 Registering FRITZ!Fon and Other Cordless (DECT) Telephones

Up to six cordless DECT telephones can be registered with the FRITZ!Box.

1. Start the registration of your cordless telephone with a base station.

2. Press and hold down the "DECT" button on the FRITZ!Box until the "Info" LED on the FRITZ!Box flashes.
3. If you are asked on your cordless telephone for the PIN of the base station, enter the PIN of the FRITZ!Box.

   The preset value is 0000. The PIN is listed in the FRITZ!Box user interface under "DECT / Base Station".

   The cordless telephone is registered with the FRITZ!Box.

4. Configure the cordless telephone in the FRITZ!Box; see page 60.

10.2 Registering an iPhone or Android Smartphone

With FRITZ!App Fon you can use your Android smartphone or iPhone as a cordless telephone registered with the FRITZ!Box.

Requirements

- iPhone iOS 4 or later, or Android smartphone with Google Android 2.1 or later

How FRITZ!App Fon Works

Once it has been set up on your smartphone, FRITZ!App Fon remains active in the background. Whenever the smartphone is connected with the FRITZ!Box over wireless LAN, the following applies:

- Outgoing calls are dialed using your landline at home rather than the mobile network.

- You can accept calls to your Internet telephone numbers and landline telephone numbers on your smartphone.

- The smartphone can still be reached at the mobile telephone number.

Registering a Smartphone with FRITZ!Box

1. Establish a wireless LAN connection to the FRITZ!Box on your smartphone; see page 31.

2. Install FRITZ!App Fon on your smartphone.

   FRITZ!App Fon is available at the Google Play Store and in the Apple App Store.

3. Start the FRITZ!App Fon.

The Icon in the FRITZ!App Fon Title Bar

The icon in the title bar of FRITZ!App Fon indicates whether you are making calls with the smartphone via FRITZ!Box:

Icon	Meaning
Telephony FRITZ!Box	Active wireless LAN connection between smartphone and FRITZ!Box.
Telephony FRITZ!Box	You are making calls with the smartphone via the FRITZ!Box.

Assigning Telephone Numbers

Assign telephone numbers to the smartphone for calls over the FRITZ!Box:

1. In the FRITZ!App Fon select "More / FRITZ!Box".

   The "Telephony device" display shows the name used to register the smartphone with the FRITZ!Box.

2. Configure the smartphone in the FRITZ!Box; see .

10.3   Connecting an IP Telephone

IP telephones are special telephones for Internet telephony ("IP" stands for "Internet Protocol"). If your FRITZ!Box is connected with a landline, you can use the connected IP telephone to make calls over the landline network as well.

Connecting via LAN or Wireless LAN

1. Connect the IP telephone to the FRITZ!Box using a network cable or wireless LAN.

   The preconfigured wireless network key of the FRITZ!Box is printed on the underside of the FRITZ!Box.

2. Configure the IP telephone in the FRITZ!Box; see .

10.4   Connecting a Door Intercom System

Door intercom systems with an a/b interface and IP door intercoms can be connected to the FRITZ!Box. Then you can answer the doorbell on your telephones, speak with visitors, and open the door, even on a mobile telephone or other telephone connection away from the home. You can configure a special ring tone to signal the doorbell on a FRITZ!Fon. You can also have the camera image from your door intercom system displayed on FRITZ!Fon telephones with a color display.

Read more in the Help of the FRITZ!Box user interface:

1.   Open the FRITZ!Box user interface.

2.   Click the Help button.

3.   Enter "door intercom system" in the Help search field.

11 Configuring the FRITZ!Box for Telephone Calls

This chapter describes how to configure your FRITZ!Box for making telephone calls.

11.1 Configuring Your Telephone Numbers

Configure the following telephone numbers in the FRITZ!Box using the wizard:

- All Internet telephone numbers that are not configured in the FRITZ!Box automatically by the provider.

- Landline telephone numbers you would like to assign to telephones and other terminal devices.

- Landline numbers for which you would like to configure convenience functions like the answering machine and call diversion.

Automatic Configuration

Some telephony providers configure the Internet telephone numbers in the FRITZ!Box automatically. This procedure is also known as "remote configuration".

Remote configuration starts right after the FRITZ!Box is connected to the Internet or right after the FRITZ!Box user interface is opened.

The configured Internet telephone numbers are located in the user interface under "Telephony / Telephone Numbers".

Configuring Telephone Numbers with the Wizard

Here is how to configure an Internet telephone number or landline telephone number in the FRITZ!Box:

1. Open the FRITZ!Box user interface.

2. Select "Wizards / Manage Telephone Numbers".

3. Click "Add Telephone Number" and follow the Wizard's instructions.

11.2 Configuring Telephones and Other Terminal Devices in the FRITZ!Box

Configure your telephones and other terminal devices in the FRITZ!Box. To do this, for each terminal device define:

- the internal name to be displayed in the call list of the FRITZ!Box.

- the telephone number the terminal device uses for outgoing calls to the public telephone network

- Numbers for incoming calls:

  Should the terminal device ring for every call (telephone) or pick up (fax machine, answering machine)? Or only for calls to previously defined telephone numbers?

Configuring Terminal Devices

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Telephony Devices".

3. Click "Configure New Device". To change the settings of a device that has already been configured, click the "Edit" button

12 FRITZ!Box as an Internet Router

The FRITZ!Box connects computers in your home network with the Internet. This chapter explains the possibilities presented by using the FRITZ!Box as an Internet router and how to take advantage of them.

12.1 Parental Controls: Access Profiles for Internet Use

Using access profiles you can control the use of the Internet by devices in your network.

Access Profiles

Settings for Internet Use

The following settings for Internet use are defined in an access profile:

Setting	Description
Online time	The online time specifies when and for how long Internet access is permitted.
Permitted Websites	Using filter lists you can specify which websites may be accessed.
Internet access through network applications	You can specify which network applications are allowed to communicate over the Internet.

Preconfigured and Own Access Profiles

- In the FRITZ!Box there are four preconfigured access profiles.

- You can create and configure many access profiles of your own.

No Network Device without Access Profile

- Network devices that log in to the home network for the first time are automatically assigned the preconfigured "Standard" access profile. As soon as a network device is registered in the home network you can assign a different access profile.

- Network devices that log in to the FRITZ!Box guest network are automatically assigned the "Guest" access profile. This is the only access profile possible in the guest network.

Preconfigured Access Profiles

In the FRITZ!Box there are four preconfigured access profiles available for use: "Standard", "Guest", "Unrestricted", and "Blocked".

The "Standard" Access Profile

Property	Description
Limitations	In the factory settings the "Standard" profile is allowed to do everything. There are no restrictions on time or activity.
Changes	The "Standard" profile can be changed.
Automatic assignment	Network devices that register with the FRITZ!Box for the first time are automatically assigned the "Standard" profile.
Assignment of Unknown Network Devices	Network devices registered with the FRITZ!Box under "Home Network / Home Network Overview / Network Connections" using the "Add Device" can only be assigned the "Standard" profile. Another profile can be assigned after the devices have been physically connected.

The "Guest" Access Profile

Property	Description
Limitations	The profile has the following settings configured upon delivery: • There are no time restrictions. • HTTPS queries are permitted. • The web pages indexed by the German federal government (BPjM) will be filtered. • Surfing and mail are allowed. Web access is blocked for all other network applications.
Changes	The "Guest" profile can be changed.
Automatic assignment	All network devices that are connected with the FRITZ!Box via the guest access always receive the "Guest" profile.

The "Unrestricted" Access Profile

Property	Description
Limitations	This profile allows unrestricted use of the Internet.
Changes	The "Unrestricted" profile cannot be changed.
Assignment	This profile can be assigned to network devices in the home network.

The "Blocked" Access Profile

Property	Description
Limitations	This profile blocks Internet use.
Changes	The "Blocked" profile cannot be changed.
Assignment	This profile can be assigned to network devices in the home network.

Access Profiles of Your Own

- In addition to the preset access profiles, you can create and configure as many access profiles of your own as you wish.

- Your own access profiles can be assigned to all known network devices in the home network.

- Your own access profiles are designed to specify tailored access rules for network devices or groups of network devices.

Changing Preconfigured Access Profiles

The preconfigured "Standard" and "Guest" profiles can be changed.

Examples of changes:

- Complete block in the "Standard" profile: When you block Internet use in the "Standard" profile, you ensure that no network device has access to the Internet by default. A network device can access the Internet only if you specifically assign a profile that allows Internet use.

- Reduced restrictions in the "Guest" profile: You can remove the filter settings in the Guest profile and thus grant your guests unrestricted access to all websites.

Online time

The online time is defined as follows:

Setting	Description
Period	On a timetable you define when the Internet connection may be used.
Online time	For each day of the week you define how long the Internet is allowed to be used.
shared budget	You decide and define whether all network devices that use the same access profile must share this online time limit. For the preconfigured "Standard" and "Guest" access profiles, no budget sharing is permitted.

Example:

For a child you can configure an access profile to be assigned to all of the child's network devices. The online time in the access profile could look something like this example:

Monday and Wednesday	from 2 pm to 9 pm; no more than 3 hours each day
Tuesday, Thursday and Friday	from 6 pm to 9 pm; no more than 3 hours each day
Saturday and Sunday	from 10 am to noon; and from 4 pm to 10 pm; no more than 5 hours each day
Shared budget	yes all devices (computer, game console, smartphone, etc.) share the online time

Permitted Websites

Access to websites with inappropriate content can be blocked using filters. The following filtering options are available:

- Prevent HTTP queries: You can prevent HTTPS queries. HTTPS is used, for instance, to open Facebook, Gmail and online banking.

- Permit websites with a whitelist:

  - The whitelist is a filter list that should be used when access should be limited to just a few websites.

  - Access to web pages entered in the whitelist is permitted.

  - When a whitelist is used, only those websites included in the list can be opened, and no others.

- Block websites with a blacklist:

  - The blacklist is a filter list that should be used when access to most websites is to be permitted, and the number of blocked websites is relatively small.

  - Access to web pages entered in the blacklist is blocked.

– If the blacklist is used, no website can be opened by entering its IP address. This is also true for websites that are not included in the blacklist.

– For applications that address websites only directly via the IP address, for instance virus scanner update software, the relevant IP addresses can be released for access by entering them in the exception list of "Permitted IP addresses".

Internet Access by Network Applications

You can list network applications for which you would like to block communication with the Internet. For instance, you can prohibit file sharing programs or online games from communicating over the Internet.

Parental controls, configuration

Requirements

The "Internet / Filters" menu is available only if you have configured the Internet connection in the FRITZ!Box and already established an Internet connection.

Limitations

The "Internet / Filters" menu is **not** available if you have configured the FRITZ!Box as an IP client. In this case, use the corresponding functions of the router whose Internet connection is being shared.

Preparations

- Configure the access profiles required for the members of the home network; see Configuring an Access Profile on page 67.

- Prepare the filter lists if you would like to use filter lists; see Editing Filter Lists from page 68.

- If desired, add the list of network applications; see Adding Network Applications from page 68.

Configuring Parental Controls for Network Devices

1. Open the FRITZ!Box user interface.

2. Select the "Internet / Filters" menu.

3. Select a network device on the "Parental Controls" tab.

4. Click the "Edit" button: [✎].

5. Select the access profile to be applied to the network device and then click "OK".

Configuring an Access Profile
Requirements

The "Internet / Filters" menu is available only if you have configured the Internet connection in the FRITZ!Box and already established an Internet connection.

Limitations

The "Internet / Filters" menu is **not** available if you have configured the FRITZ!Box as an IP client. In this case, use the corresponding functions of the router whose Internet connection is being shared.

Setting up an access profile

1. Open the FRITZ!Box user interface.

2. Select the "Internet / Filters" menu.

3. Select the "Access Profiles" tab.

4. Click New access profile .

5. Configure the settings for the access profile in the "New Access Profile" window. Use the FRITZ!Box Help.

Editing Filter Lists

Requirements

The "Internet / Filters" menu is available only if you have configured the Internet connection in the FRITZ!Box and already established an Internet connection.

Limitations

The "Internet / Filters" menu is **not** available if you have configured the FRITZ!Box as an IP client. In this case, use the corresponding functions of the router whose Internet connection is being shared.

Editing a Filter List

1. Open the FRITZ!Box user interface.

2. Select the "Internet / Filters" menu.

3. Select the "Lists" tab.

4. Select the list you would like to edit and then click "Edit".

5. Edit the list in the window that opens.

Adding Network Applications

Requirements

The "Internet / Filters" menu is available only if you have configured the Internet connection in the FRITZ!Box and already established an Internet connection.

Limitations

The "Internet / Filters" menu is **not** available if you have configured the FRITZ!Box as an IP client. In this case, use the corresponding functions of the router whose Internet connection is being shared.

Adding a Network Application

1. Open the FRITZ!Box user interface.

2. Select the "Internet / Filters" menu.

3. Select the "Lists" tab.

4. Click [Add Network Application].

5. In the "Network Application" window, enter the network application you would like to add to the list.

AVM FRITZ!Box Parental Controls for Windows Users

In the Windows operating systems (Windows 10, Windows 8 and Windows 7), parental controls can be also configured for each individual Windows user.

You will need the "AVM FRITZ!Box Parental Controls" software if multiple Windows users with different rights in the Internet are sharing a single computer. The "AVM FRITZ!Box Parental Controls" software detects the various Windows users.

AVM FRITZ!Box Parental Controls

- The AVM FRITZ!Box software can be downloaded free of charge from the AVM website.

- The AVM FRITZ!Box parental control software must be installed on every Windows computer on which users are configured who are to be protected by parental controls.

- AVM FRITZ!Box parental controls are installed on the computer as a service. The service must be enabled at all times. If it is not enabled, the FRITZ!Box will not detect the user accounts. Windows users that are not detected are treated like user accounts without any parental controls.

Downloading AVM FRITZ!Box Parental Controls from the AVM Website

1. Open the AVM website: en.avm.de.

2. Select "Service".

3. Scroll to the area "Further service information."

4. Click "FTP Server".

   This will take you to AVM's FTP server.

5. Select "fritz.box".

6. Select "tools".

7. Select "kindersicherung".

8. Select "english".

9. Click the exe file and save the program on your computer.

Configuring Parental Controls for Windows Users

1. Open the FRITZ!Box user interface.

2. Select the "Internet / Filters" menu.

3. Select a Windows user on the "Parental Controls" tab.

4. Click the button.

5. Select the access profile to be applied to the Windows user and then click "OK".

12.2 Sharing: Making Computers Accessible from the Internet

With default settings in the FRITZ!Box, programs on your computer and LAN cannot be accessed from the Internet.

For applications like online games and file sharing software or server services like HTTP, FTP, VPN, terminal and remote access servers, you have to make your computer accessible for other Internet users.

Port Sharing

Using port sharing you allow incoming connections from the Internet. By releasing certain ports for incoming connections, you grant controlled access to the computers in your network to other Internet users.

The following port forwarding methods are possible in the FRITZ!Box:

PING	IPv4: The FRITZ!Box responds to ping inquiries from the Internet addressed to the IPv4 address of the FRITZ!Box.
	IPv6: The FRITZ!Box responds to ping inquiries from the Internet addressed to the IPv6 address of the FRITZ!Box. Additionally, you can set up PING6 port forwarding rules for each computer in the home network since each computer has its own globally valid IPv6 address.
TCP UDP	IPv4: Within IPv4 networks you can open the FRITZ!Box firewall for the protocols TCP and UDP when entering the port range. One port can be opened for exactly one computer.
	IPv6: Within IPv6 networks you can open the FRITZ!Box firewall for the protocols TCP and UDP when entering the port range. One port can be opened for each computer in the network.
ESP GRE	IPv4: Within IPv4 networks you can open the firewall for the two protocols ESP and GRE, which do not use ports.
Exposed host (Open firewall completely)	IPv4: Within IPv4 networks you can open the firewall completely for one computer. This computer is then no longer protected by the FRITZ!Box firewall. If individual ports are already open for other computers, then data packets for these ports are not forwarded to the exposed host, but to the other computer instead.
	IPv6: Within IPv6 networks you can open the firewall completely for each computer. These computers are then no longer protected by the FRITZ!Box firewall.

Configuring Port Forwarding in the FRITZ!Box

- IPv4:

    – Port sharing is configured in the "Internet / Permit Access" menu, on the "Port Forwarding" page.

- IPv6:

    – Enable the advanced view.

    – Port sharing is set up in the "Internet / Permit Access" menu, on the "IPv6" page.

Determining the IPv4 Address for Accessing the FRITZ!Box

If you have enabled ports for forwarding in the FRITZ!Box, other Internet users can access your computers at the IP address assigned to your FRITZ!Box by the Internet service provider. This is a public IPv4 address.

Here is how to determine the public IPv4 address of the FRITZ!Box:

1. Open any Internet page in order to establish an Internet connection.

2. Open the FRITZ!Box user interface.

3. Enable the advanced view.

4. The FRITZ!Box's public IPv4 address is displayed on the "Overview" page in the "Connections" area.

Can Always Be Reached, Even When the IP Address Changes

Every time the Internet connection is interrupted, the Internet service provider re-assigns the IP address. The IP address may change in the process. Therefore it is a good idea to use MyFRITZ! or dynamic DNS so that the IP address can always be reached under the same name. For more information about MyFRITZ!, see the chapter MyFRITZ!: Accessing the FRITZ!Box from Anywhere on page 148. For more information about dynamic DNS, see the section Dynamic DNS: Name Instead of IP Address on page 73.

12.3 Dynamic DNS: Name Instead of IP Address

Dynamic DNS is an Internet service that makes it possible for the FRITZ!Box to remain accessible from the Internet at all times under a fixed name, even though the public IP address changes.

Dynamic DNS can be used as an alternative to MyFRITZ!. Both services can be used in parallel.

You must register with a dynamic DNS provider to use this service. When you register, you agree on the fixed name (domain name) at which your FRITZ!Box should be accessible from the Internet. You also define a user name and password.

Every time the IP address changes, the FRITZ!Box transmits the new IP address to the dynamic DNS provider in the form of an update request. Then the domain name is assigned to the current IP address by the dynamic DNS provider.

Configuring Dynamic DNS in the FRITZ!Box

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Internet / Permit Access" menu.

4. Select the "Dynamic DNS" page and set up dynamic DNS. See the Help available in the FRITZ!Box user interface for more information.

12.4 Access from the Internet via HTTPS, FTP and FTPS

Over the Internet it is possible to access the user interface of the FRITZ!Box. With a laptop, smartphone or tablet PC you can configure settings in the FRITZ!Box user interface.

Requirements for Access over the Internet

- Access to the user interface: Every user who would like to access the FRITZ!Box externally from the Internet requires a FRITZ!Box user account which is authorized for access from the Internet.

- Access to storage: Every user who would like to access the storage of the FRITZ!Box externally from the Internet requires a FRITZ!Box user account with the rights to access from the Internet and to access the contents on the storage media.

- The protocols for the desired access must be enabled in the FRITZ!Box.

HTTPS, FTP and FTPS

The protocols HTTPS, FTP and FTPS are used for access over the Internet.

- HTTPS (Hypertext Transfer Protocol Secure)

  HTTPS is an Internet protocol for bug-proof communication between the web server and the browser in the World Wide Web.

  Enable this protocol to allow access to the FRITZ!Box from the Internet.

- FTP (File Transfer Protocol)

  FTP is a network protocol for transmitting files in IP networks.

  Enable this protocol to allow access by FTP to the FRITZ!Box storage media from the Internet.

- FTPS (FTP over SSL)

  FTPS is a method for encrypting the FTP protocol.

  Enable this protocol to secure transmission over FTP.

Enabling HTTPS, FTP and FTPS in the FRITZ!Box

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Internet / Permit Access" menu.

4. Select the "FRITZ!Box Services" page and enable the protocols you need. See also the Help on the user interface.

12.5   Prioritization: Right of Way for Internet Access

Prioritization is a function you can use to specify that network applications and network devices be treated with higher or lower priority when they access the Internet connection. For example, you may wish to ensure that applications like Internet telephony, IPTV and video on demand are always treated with higher priority than other applications. You can also specify that file-sharing applications like eMule and BitTorrent always have to wait behind online games.

Categories for Prioritization

There are three categories for prioritization: "Real-time applications", "Prioritized applications" and "Background applications".

Network applications and network devices are assigned to the categories using rules.

Real-time Applications

- Network applications of this category always have priority over other applications accessing the Internet at the same time.

- When the Internet connection is working at full capacity, the network packets of the applications of this category will always be sent first. In this case data from network applications assigned to other categories will be transmitted later.

- If multiple network applications are assigned to this category, then they must share the available capacity.

- Whenever Internet telephony is included in this category, this application always has the highest priority, even over other real-time applications.

Prioritized Applications

This category is suitable for applications that require a fast reaction time (for example, company access, terminal applications, games).

- For network applications prioritized in this category, 90% of the FRITZ!Box's upload bandwidth is available, as long as no application from the "Real-time applications" category requires bandwidth. The remaining 10% of the upload bandwidth is available for applications that are prioritized in lower categories or not prioritized at all.

- If multiple network applications are assigned to the "Prioritized applications" category, then they must share the available capacity.

Background Applications

This category is suitable for applications that do not require any high transmission rates and which are not time-critical (for example, peer-to-peer services or automatic updates).

- Network applications assigned to this category are always treated with the lowest priority when the Internet connection is working at full capacity. So whenever an application from a different category or a non-prioritized application requires the entire bandwidth, all background applications must wait until bandwidth capacity becomes available again.

- If no other network applications are active, then the background applications receive the entire bandwidth.

Prioritization Method in the FRITZ!Box

The following techniques are used in the FRITZ!Box to send data packets according to their prioritization:

- Change in the order in which packets are sent to the Internet (upstream direction)

  The order of the packets the FRITZ!Box receives from the Internet (downstream direction) cannot be changed.

- Discard low-priority packets in order to ensure the transmission of higher-priority packets. This technique is used whenever more packets are supposed to be sent to the Internet than the upstream transmission rate of the Internet connection allows.

- As long as no packets are being sent from higher-priority applications, the full transmission rate of the Internet connection is available for low-priority packets.

Configuring Prioritization in the FRITZ!Box

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Configure prioritization in the "Internet / Filters / Prioritization" menu.

12.6 VPN: Remote Access to the Home Network

Via a VPN (Virtual Private Network) a secure remote access to the network of the FRITZ!Box can be established.

VPN in the FRITZ!Box

IPSec	VPN in the FRITZ!Box is based on the IPSec standard.
Computer—LAN	Computer-LAN linkup: VPN connections can be configured for individual remote computers.
LAN—LAN	LAN-LAN linkup: VPN connections can be configured for remote networks.
Eight simultaneous connections	FRITZ!Box supports a maximum of eight simultaneous VPN connections.
Configuration software	The configuration files for the VPN connections are created using a separate program. The program is provided free of charge and can be downloaded from the AVM website.
FRITZ!Box user	For FRITZ!Box users who have the right to access the FRITZ!Box via VPN, no further settings must be configured. All required VPN settings are included in the user account.
VPN client	A free VPN client for individual computers can also be downloaded from the AVM website.

The AVM website offers a service page which presents comprehensive information on VPN in general and in connection with the FRITZ!Box. Visit this page to obtain more detailed information.

en.avm.de/service/vpn/overview

Configuring VPN in the FRITZ!Box

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Internet / Permit Access" menu.

4. Select the "VPN" page.

See also the Help available in the FRITZ!Box user interface for assistance with configuring VPN.

Supplementary Software for VPN

All of the information required for a VPN is saved in a configuration file. The terminals involved in any VPN must receive this file.

Individual computers that are networked over a VPN require a VPN client.

*   The "Configure FRITZ!Box VPN Connection" Wizard

    AVM provides the "Configure FRITZ!Box VPN Connection" software for creating configuration files. This program is a Wizard that takes you step by step through the VPN configuration. All of the necessary VPN settings, like the encryption method and access rules, are set automatically. The resulting configuration files must be imported to the terminals of the VPN tunnel. At the terminal with the FRITZ!Box the configuration file is then imported to the FRITZ!Box. The VPN parameters in these files can be adjusted manually to connect to products by other manufacturers.

*   The "FRITZ!VPN" VPN client

    AVM offers the "FRITZ!VPN" software as a VPN client.

Both the Wizard and the client can be downloaded free of charge from the VPN Service page on the AVM website:

en.avm.de/service/vpn/overview

12.7 Freely Selectable DNS Servers

DNS servers are preset in the FRITZ!Box for IPv4 and IPv6.

These are the DNS servers assigned by the Internet service provider.

For both IPv4 and IPv6, the preset DNS server can be replaced by a free DNS server. Free DNS servers include, for instance, OpenDNS and Google DNS.

Here is how to change the DNS server entry:

The "DNSv6" page is displayed only if you enabled IPv6 support for the FRITZ!Box on the "IPv6" page.

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. In the "Internet / Account Information" menu, select the "DNS Server" page.

4. Change the settings for the DNS servers.

12.8 DNSSEC: Security for DNS Queries

DNSSEC is short for Domain Name System Security Extensions. As the name says, this is an extension of DNS, the domain name system.

DNSSEC ensures that both the DNS server and the information returned by the DNS server are authentic, or genuine.

Security with DNSSEC

When a home user surfs the web, she or he sends queries to the Internet by entering URLs in the address field of the browser. A URL is the name of a website that is easy to remember, for instance en.avm.de. Every query is sent to the

DNS server first. The DNS server resolves the URL into the corresponding IP address. There is one unique IP address for every URL.

The home user relies on the authenticity of the IP address returned by the DNS server. Authentic means that the response is the IP address of the desired website, and not a faked IP address that leads to a fake website. DNSSEC can ensure that the returned addresses are authentic.

Support with the FRITZ!Box

The FRITZ!Box supports DNSSEC queries over UDP.

The FRITZ!Box has a DNS proxy. The computers in the home network use the FRITZ!Box as a DNS server. The FRITZ!Box forwards DNSSEC queries from the home network to the Internet. The FRITZ!Box forwards DNSSEC responses from the Internet to the home network. The DNSSEC information must be validated on the computer in the home network. For this DNSSEC must be supported in the operating system.

12.9   IPv6: The New Internet Protocol

IPv6 stands for Internet protocol version 6 and is the successor to IPv4.

The FRITZ!Box supports the new IPv6 web protocol and can establish IPv6 connections:

- IPv6 support can be switched on in the FRITZ!Box user interface.

- For simultaneous use of IPv6 and IPv4, the FRITZ!Box supports Dual Stack and Dual-Stack Lite. This means that the FRITZ!Box can communicate with both IPv4 and IPv6 domains in the Internet.

- The FRITZ!Box supports native IPv6 and IPv6 with a tunnel protocol. Native IPv6 means that your Internet service provider supports IPv6 directly on your line.

IPv6-Capable Services in the Home Network

- Access to the user interface with http or https over IPv6

- The DNS resolver of the FRITZ!Box supports queries for IPv6 addresses (AAAA records) and can query the upstream DNS resolver of the Internet service provider over IPv6.

- The globally valid prefix is distributed via router advertisement.

- For guest access to the wireless LAN, the home network and wireless guests are separated by IPv6 subnetworks.

- UPnP, UPnP AV media server

- Automatic provisioning (TR-064)

IPv6-Capable Services in the Internet

- Completely closed firewall to protect against unwanted data from the Internet (Stateful Inspection Firewall)

- Voice over IPv6

- Automatic provisioning (TR-069)

- Time synchronization over NTP (Network Time Protocol)

- Remote access via HTTPS

- Dynamic DNS via dyndns.org and namemaster.de

Configuring IPv6 in the FRITZ!Box

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Internet / Account Information" menu.

4. Select the "IPv6" page and configure IPv6 in the FRITZ!Box. See the Help available in the FRITZ!Box user interface for more information.

Configuring IPv6 on the Computer

You can establish connections in the IPv6 range of the Internet only if IPv6 is installed and enabled on the computers in your home network.

- IPv6 is already installed and enabled in the Windows 10, Windows 8 and Windows 7 operating systems.

- IPv6 has been available in the Mac OS X operating systems since Mac OS 10.

12.10 Mobile Network: Replacing Faulty DSL

Internet access over the mobile telephone network can be set up so that the mobile telephone connection is established automatically whenever the DSL connection fails. This guarantees Internet access even when the DSL connection is fails. A USB modem for mobile Internet access (LTE/UMTS/HSPA) and a SIM card from a mobile communications provider are required for this.

Here is how to set up the mobile telephone connection as a substitute upon DSL failure:

1. Insert the USB modem in the USB port on the FRITZ!Box.

2. Open the FRITZ!Box user interface.

    In the "Internet" menu, the sub-menu "Mobile Communications" is displayed.

    The "Mobile Communications" menu is not available until the UMTS/HSPA modem has been connected to the USB port of the FRITZ!Box.

3. Select the setting "Automatically enable the mobile connection when the DSL connection is disrupted".

4. Configure the settings for your Internet connection over the mobile communications network. In the Help of the FRITZ!Box user interface you can find detailed instructions.

Access to the Internet is now guaranteed, even when the DSL connection fails.

As soon as the DSL connection is stable and available for at least 30 minutes, the connection will be switched back to DSL.

12.11 LISP: FRITZ!Box as a LISP Router

LISP is a routing architecture which separates information about location and identity. There are two IP addresses: one for the location and one for the identity.

The FRITZ!Box can be configured as a LISP router.

- This chapter address system administrators.

- It presents a short introduction to LISP.

- You receive an overview about the possibilities for using LISP.

- This section includes instructions on how to configure the FRITZ!Box as a LISP router.

Definition and Components

LISP: Definition

LISP: Locator/Identifier Separation Protocol	
IP protocol	LISP is a protocol for the transmission of IP packets.
IP address pairs	LISP uses IP address pairs: • One IP address for identification, which is called the EID (Endpoint Identifier). The EID can be the IP address of a host or an entire IP subnet. • One IP address for the location, known as the RLOC (Routing Locator). The RLOC is the IP address of the LISP router.
Tunnel protocol	LISP is a tunnel protocol. A LISP packet consists of an internal IP packet and an additional external header. The header of the internal packet contains the EID; the external header contains the RLOC.

Properties of RLOC and EID

RLOC	• specifies the location where the addressed network (network segment or network device) is located
	• is assigned by the Internet service provider
	• is a public IP address
	• is contained in the external header of the LISP packet
	• can be an IPv4 address
	• can be an IPv6 address
EID	• identifies a network (network segment or network device)
	• is assigned by the LISP provider
	• is contained in the internal header of the LISP packet
	• can be an IPv4 address
	• can be an IPv6 address
	• can be a public IP address
	• can be a private, non-public IP address

Components of a LISP System

Mapping system	The mapping system is responsible for allocating the EIDs to the RLOCs.
ETR (Egress Tunnel Router)	The ETR accepts IP packets whose destination IP address contained in the external header is the ETR's own RLOC. ETR unpacks the LISP packets.
ITR (Ingress Tunnel Router)	The ITR accepts IP packets from members of the local IP network (EID network) and packs them into LISP packets. The external header of the LISP packet contains the RLOC of the destination network (remote EID network) as the destination address.

PETR (Proxy ETR)	A PETR (Proxy ETR) is required for communication between LISP sites and non-LISP sites. On the LISP side it works like a LISP router; on the non-LISP side it works like a native IP router.
PITR (PROXY ITR)	A PITR (Proxy ITR) is required for communication between LISP sites and non-LISP sites. On the LISP side it works like a LISP router; on the non-LISP side it works like a native IP router.
xTR	xTR is what we call a component that is both ETR and ITR. xTR is also known as a tunnel endpoint or encapsulation endpoint.

Possible Uses

- LISP is useful if technical or organization reasons make it preferable to keep the same IP addresses, even when you switch Internet service providers.

  Mobility example: When you change locations, devices do not lose their identity (host devices, virtual machines).

- LISP is suitable for communication between IPv4 and IPv6 networks.

- Transport of address families: IPv4 via IPv4, IPv4 via IPv6, IPv6 via IPv6, IPv6 via IPv4

  Example: The encapsulation of IPv6 packets in IPv4 headers allows IPv6 web sites to be connected over IPv4.

Configuring FRITZ!Box as a LISP Router

FRITZ!Box as a LISP Router

- The FRITZ!Box can be configured as a LISP router.

- As a LISP router the FRITZ!Box is an xTR (ETR and ITR).

Preparations

You need a LISP provider.

➡ Register with a LISP provider.

All of the information you need to configure the FRITZ!Box as a LISP router is supplied by the LISP provider.

Configuring a LISP Router

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Internet / Account Information" menu.

4. Select the "LISP" tab.

5. Enable the setting "LISP support enabled".

6. Enter in the fields the information you received from the LISP provider.

13 FRITZ!Box as a Wireless Access Point

The FRITZ!Box is a wireless access point for wireless devices like notebooks, tablets or smartphones. The FRITZ!Box can establish wireless LAN connections compliant with the fast Wireless N standard. The FRITZ!Box is preconfigured with encryption using today's safest method WPA2. This encryption method is supported by most of the latest wireless devices. The FRITZ!Box supports wireless LAN convenience functions like night service and WPS Quick Connection.

13.1 Switching the Wireless Radio Network On and Off by Schedule

You can configure a schedule for times at which the wireless network of the FRITZ!Box is to be turned on and off automatically. This reduces the power consumption of the FRITZ!Box.

The FRITZ!Box schedule also affects any other AVM products connected in the network, the FRITZ!WLAN Repeater, for instance: the radio network of these devices is also switched on and off for the specified times.

1. Open the FRITZ!Box user interface.

2. Open the "WLAN / Schedule" menu.

3. Enable the schedule for the wireless radio network.

4. Configure the settings for the schedule:

   – With the options "Switch off wireless LAN daily" and "Switch off wireless LAN according to schedule" you define the intervals for switching.

   – You can also enable the option "The radio network cannot be switched off until no more wireless LAN devices are active".

5. Click "Apply" to save your settings.

Now the schedule of the FRITZ!Box is enabled and configured.

In the Help of the FRITZ!Box user interface you can find detailed instructions.

Switching Wireless LAN On and Off

You can switch the wireless radio network of the FRITZ!Box on and off at any time, even when the device is hibernating.

➡ Press the "WLAN" button on the FRITZ!Box briefly.

or

➡ Switch on the wireless LAN radio network using a connected telephone:

wireless LAN on ✪❾❻✪❶✪

wireless LAN off ✪❾❻✪⓿✪

13.2 Extending a Wireless LAN Network

The range of a wireless radio network is not fixed. It depends on

- the wireless devices you are using for your wireless LAN connections
- interference in the vicinity of your wireless radio network
- the structural conditions where you operate the wireless radio network
- the number of wireless devices in the vicinity of your FRITZ!Box that work in the same frequency range

You can extend the range of your wireless radio network with a wireless LAN repeater.

Or you can set up a second FRITZ!Box as a wireless LAN repeater.

Extending a Wireless Radio Network with a Wireless LAN Repeater

You can extend your wireless radio network with a wireless LAN repeater. In combination with the FRITZ!Box the AVM FRITZ!WLAN Repeater is especially suitable. All models of the FRITZ!WLAN Repeater series can be integrated into your wireless radio network and your home network by WPS Quick Connection. Find out more in the Internet at:

en.avm.de/products/fritzwlan

Using an Existing FRITZ!Box as a Repeater

You can extend the wireless LAN radio network of your FRITZ!Box with an additional FRITZ!Box you already have. To extend your wireless LAN, configure the repeater function in this device.

You can configure a FRITZ!Box as a repeater by working through the following steps:

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "WLAN / Repeater" menu and follow the instructions displayed on the screen.

In the Help of the FRITZ!Box user interface you can find detailed instructions.

13.3 Wireless LAN—Getting Technical

A wireless LAN is based on standards defined by the Institute of Electrical and Electronic Engineers (IEEE). These standards describe, for instance, the transmission rate, encryption methods and frequencies used in a wireless network.

Throughput Rate

The FRITZ!Box supports your choice of the standards IEEE 802.11b, IEEE 802.11g and IEEE 802.11n. Wireless devices based on one or more of the standards listed can be used for wireless LAN connections with the FRITZ!Box.

Standard	Frequency Band	Transmission Rate (Gross) up to	Transmission Rate (Net) up to
802.11b	2.4 GHz	11 Mbit/s	5 Mbit/s
802.11g	2.4 GHz	54 Mbit/s	25 Mbit/s
802.11n	2.4 GHz	300 Mbit/s	150 Mbit/s

IEEE 802.11b

With a maximum transmission rate of 11 Mbit/s, this is the oldest wireless standard. Older wireless devices of the first generation can communicate with the FRITZ!Box using 802.11b. However, if the wireless device supports newer standards such as 802.11g, the latest standard should be used.

IEEE 802.11g

In this wireless LAN standard data are transmitted in the 2.4-GHz range at a maximum gross throughput of 54 Mbit/s. This standard is compatible with a wide range of wireless devices.

IEEE 802.11n

This standard provides for high transmission rates and ranges. The FRITZ!Box supports 802.11n in the 2.4-GHz frequency band. Modulation processes and antenna techniques like MIMO (Multiple Input, Multiple Output) use the frequency band more effectively than the older standards.

The use of the 802.11n standard—and thus the availability of higher throughput rates—is possible only if the wireless LAN connection is secured using the WPA2 security mechanism (AES-CCMP).

Setting the Right Standard in the FRITZ!Box

The throughput rate that can be achieved in your wireless radio network depends on the wireless standards used by the integrated wireless devices. These wireless standards must also be set in the FRITZ!Box. Proceed as follows to check which wireless LAN standards are set and change them if needed:

1.   Open the FRITZ!Box user interface.

2.   Enable the advanced view.

3.   Open the "WLAN / Radio Channel" menu and select "Adjust radio channel settings" to make the desired changes.

Make a note of which standards the wireless devices in your network are compatible with and then adjust the FRITZ!Box settings according to the following information:

11n, 11g

In your radio network there are wireless LAN devices that are compatible with one or both of the following standards:

- 802.11n
- 802.11g

In this case set the wireless LAN standard for the 2.4-GHz frequency band to: 802.11n+g

11g, 11b

In your radio network there are wireless LAN devices that are compatible with one or both of the following standards:

- 802.11g
- 802.11b

In this case set the wireless LAN standard for the 2.4-GHz frequency band to: 802.11b+g

11n, 11g, 11b

In your radio network there are wireless LAN devices that are compatible with one or all of the following standards:

- 802.11n
- 802.11g
- 802.11b

In this case set the wireless LAN standard for the 2.4-GHz frequency band to: 802.11n+b+g.

The Standard for Security

IEEE 802.11i

The WPA2 security mechanism is defined in the IEEE 802.11i standard. WPA2 is an extension of the familiar security mechanism WPA (Wi-Fi Protected Access).

The main feature of the extension of WPA to WPA2 is the AES-CCMP encryption process.

Mechanism	Encryption
WPA	TKIP (Temporary Key Integrity Protocol)
WPA2	TKIP
	AES-CCMP
	based on the extremely secure AES (Advanced Encryption Standard) procedure. CCMP (Counter Mode with CBC-MAC Protocol) defines how the AES procedure is applied to wireless LAN packets.

FRITZ!Box supports the AES encryption procedure as part of the WPA2 mechanism, and the TKIP encryption procedure as part of the WPA mechanism. This means that the FRITZ!Box can be used in combination with any wireless devices that also support WPA2 with AES or WPA with TKIP.

Frequency Ranges

Wireless LAN uses the frequency ranges at 2.4 GHz and 5 GHz for transmission.

With the FRITZ!Box 7369 you can establish wireless LAN connections in the 2.4-GHz range.

2.4-GHz Frequency Band

In the 2.4-GHz frequency band wireless LAN works in the same range as Bluetooth, microwave devices and various other devices like radio-controlled toys, garage-door openers and video bridges. This means that interference may occur within wireless networks operated in the vicinity of such devices. Generally this has adverse effects on the transmission rate, including aborted connections.

In the 2.4-GHz frequency range the European regulatory authorities have designated 13 channels for wireless LAN.

A channel can have a bandwidth of 20 MHz (throughput of up to 130 Mbit/s) or 40 MHz (throughput of up to 300 Mbit/s).

Channels located directly next to each other in the 2.4-GHz band may overlap and result in mutual interference. For instance, if several wireless networks are operated close to each other in the 2.4-GHz frequency range with a bandwidth of 20 MHz, a distance of at least five channels should be left empty between each two channels used. This means that if channel 1 is selected for one wireless network, the channels 6 through 13 can be selected for a second wireless network. This maintains the minimum distance between channels.

Should interference in a wireless network persist, the first step should be to select a different channel.

Wireless Auto Channel

With the wireless auto channel function, the FRITZ!Box automatically searches for the channel subject to the least interference. This process takes into consideration interference from radio networks in the vicinity (wireless access points) and potential sources of interference (for instance video bridges, baby monitors, microwave ovens). Should problems with interference persist despite this function, try to identify the source of interference and switch it off manually.

Allocation of the Wireless LAN Channels in the 2.4-GHz Range

Channel	Frequency (GHz)	Channel	Frequency (GHz)
1	2.412	8	2.447
2	2.417	9	2.452
3	2.422	10	2.457
4	2.427	11	2.462
5	2.432	12	2.467
6	2.437	13	2.472
7	2.442		

14   FRITZ!Box as a Telephone System

This chapter describes how to use the FRITZ!Box as a telephone system.

14.1   Telephone Book

How Can I Use the Telephone Book?

On FRITZ!Fon telephones, the telephone book is available in the menu. You can configure a separate telephone book for each FRITZ!Fon, see page 94.

On all telephones you can make calls using quick-dial numbers assigned to the telephone book entries. With Click to Dial you can place calls by just clicking telephone book entries with the mouse, see page 95.

Creating a New Telephone Book Entry

1.   Open the FRITZ!Box user interface.

2.   Select "Telephony / Telephone Book".

3.   Click "New Entry".

4.   Enter the information on the contact.

   In the first telephone book you can also enter a quick-dial number.

   In the Help of the FRITZ!Box user interface you can find detailed instructions.

5.   Save with "OK".

Creating a New Telephone Book for FRITZ!Fon

1.   Open the FRITZ!Box user interface.

2.   Select "Telephony / Telephone Book".

3.   Click the "New telephone book" link.

4.   Select "Create as new".

5. Under "Telephone Assignment", select all FRITZ!Fon cordless telephones on which you would like to use the telephone book.

6. Save with "OK".

Configuring Online Telephone Books (for instance, Google Contacts)

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Telephone Book".

3. Click the "New telephone book" link.

4. Select "Use the telephone book of an e-mail account".

5. Select a provider and enter the e-mail address and password.

6. Under "Telephone Assignment", select all FRITZ!Fon cordless telephones on which you would like to use the telephone book.

7. Save with "OK".

8. For Google contacts you can also select contact groups.

   In the Help of the FRITZ!Box user interface you can find detailed instructions.

Synchronizing Online Contacts

The FRITZ!Box synchronizes the configured online telephone books with the telephone book of your e-mail account every 24 hours.

You can also synchronize the telephone books with the click of a button. In the Help of the FRITZ!Box user interface you can find detailed instructions.

Configuring Click to Dial

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Telephone Book / Click to Dial".

3. Enable click to dial and select a telephone.

4. Save with "OK".

You can use click to dial. In the Help of the FRITZ!Box user interface you can find detailed instructions.

14.2 Call List

The call list contains your telephone conversations and calls you missed.

Symbols in the Call List

The symbol in front of a call shows the kind of call concerned:

Icon	Meaning
	Outgoing call
	Incoming call
	Missed call (call that was not picked up)
	Rejected call The call was rejected by pressing a button on the telephone or automatically through a call block.

Saving New Telephone Numbers in the Telephone Book

New telephone numbers can be saved to the telephone book with a mouse click:

1. In the call list, click the "Add to Telephone Book button "

2. Select an option:

   create new: Create a new telephone book entry

   add to: Add a telephone number to an entry

3. Click "Next".

Saving the Call List in a CSV File

You can save the call list in a CSV file on your computer. CSV files can be opened and processed in spreadsheet programs.

1. Click the "Save" button in the call list.

2. Select "Save" or "Save File". What to do next depends on the web browser you are using.

FRITZ!App Ticker for Android Smartphones

FRITZ!App Ticker shows the call list and new messages on the answering machine on your Android smartphone.

For more information, read en.avm.de/products/fritzapps.

14.3 Answering Machine

You can use the FRITZ!Box as an answering machine without connecting any additional devices.

If you have several telephone numbers, you can configure up to five different answering machines.

Features

- Voice to mail: If desired you can receive any new messages automatically by e-mail.

- Schedule: You can define times for the answering machine to switch on and off on different days of the week.

- Remote playback: You can check the answering machine from on the go.

Configuring an Answering Machine

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Answering Machine".

3. Click the "Settings" button to configure the first answering machine.

   To configure a new answering machine, click the "Another answering machine" link.

In the Help of the FRITZ!Box user interface you can find detailed instructions.

Picking Up a Call from the Answering Machine

You can pick up on your telephone a call that has already been accepted by the answering machine:

1. Press the keys ✱ ⓪ ⑨ on the telephone.

2. Pick up the handset.

You are connected with the caller.

Operating the Answering Machine on FRITZ!Fon

You can operate the answering machine in the menu of your FRITZ!Fon cordless telephones.

For comprehensive instructions, see the current FRITZ!Fon manual on en.avm.de/service/manuals/fritzfon.

Operating the Answering Machine Using the Voice Menu

Using a voice menu you can operate the answering machine on any telephone connected with the FRITZ!Box.

Audio prompts in the voice menu guide the user through operation. Use the telephone keys to select functions.

1. Press the following keys on the telephone:

For ...	Keys
Answering Machine 1	✱ ✱ ⑥ ⓪ ⓪
Answering Machine 2	✱ ✱ ⑥ ⓪ ①
Answering Machine 3	✱ ✱ ⑥ ⓪ ②
Answering Machine 4	✱ ✱ ⑥ ⓪ ③
Answering Machine 5	✱ ✱ ⑥ ⓪ ④

2. Pick up the handset.

3. Follow the audio prompts in the voice menu.

   You can also simply press a key on the telephone without waiting for the prompts.

   An overview of the voice menu is presented on .

Overview of the Voice Menu

Main Menu

Key	Function
❶	Play back messages
❷	Delete all messages
❸	Switching the Answering Machine On and Off
❹	Record a greeting
❺	Enable recording mode (callers can leave messages) or announcement mode (answering machine does not record any messages)

The "Listen to Messages" Menu

Key	Function
❸	Return caller's call
❺	Delete message
❼	To previous message
❾	to next message

The "Record Greeting" Menu

Key		Function
❶		Greeting for recording mode
❷		Greeting for announcement mode
❸		Closing message at end of recording length
	❶	Listen to greetings › Select greeting with ❷
	❺	Delete greeting/announcement
	❽	Start recording › End recording with ❶

Key	Function
0	Listen to messages in current menu from the beginning
#	Back to main menu

14.4 Fax Function

With the FRITZ!Box you can send and receive faxes without a fax machine. The FRITZ!Box can be configured to forward received faxes by e-mail.

Configuring the fax function

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Telephony Devices".

3. Click "Configure New Device".

4. Under "Integrated in the FRITZ!Box", select the "Fax function" option and confirm by clicking "Next".

5. Enter the fax ID in the following format:

   +49 30 12345 (country code, area code without 0, your fax number)

6. Define whether the FRITZ!Box forwards incoming faxes by e-mail or saves them.

   You can also enter multiple e-mail addresses. Use a comma to separate the individual addresses.

7. Click "Next".

8. Select your fax number. Please note:

   The fax function accepts all calls to the selected number, including telephone calls.

   If you would like to take telephone calls at this number, too, you can set up automatic fax detection.

9. Click "Next" and "Apply".

The fax function is configured.

Configuring Automatic Fax Detection

Here is how automatic fax detection works:

The answering machine checks each incoming call to see whether it is a telephone call or a fax. Callers can leave a message, and faxes are forwarded to the fax function.

Here is how to enable automatic fax detection:

1. Open the FRITZ!Box user interface.

2. Configure the fax function; see page 100.

3. Select "Telephony / Telephony Devices".

4. Click the "Edit" button to open the settings of the fax function

5. Click the "Help" button.

    The Help on the fax function contains instructions on how to configure automatic fax detection.

Sending Faxes from the User Interface

1. Configure the fax function. For instructions, see Configuring the fax function on page 100.

2. Open the FRITZ!Box user interface.

3. Select "Telephony / Fax".

4. Select the recipient's name and fax number from the telephone book and enter the data in the "to" and "Fax number" fields.

5. You can enter your name and address in the "Sender" field.

6. Select a fax number from the "Send with" list. The list contains all telephone numbers assigned to the fax function.

7. Enter a subject and the text of your fax.

8. In the Internet browser **Google Chrome** or **Mozilla Firefox,** you can attach an image to the fax. Click "Browse" to select an image.

   You can attach jpg or png files. Other files like PDF or Word files cannot be sent by fax.

   Images smaller than DIN A4 will be centered. Images larger than DIN A4 will be reduced in size.

9. Click "Send".

   Fax sending begins.

14.5 Call Diversion

You can configure call diversion for incoming calls in the FRITZ!Box.

Which calls can I divert?

Call diversion can be set up for the following calls:

- All incoming calls
- All calls from a certain telephone number or a certain person in the telephone book
- If you have multiple telephone numbers: all calls for a certain telephone number or a certain telephone
- All anonymous calls in which the caller does not transmit a telephone number

Where can I divert calls to?

You can divert calls to:

- Another telephone number (a different telephone line or mobile telephone number)
- One of the FRITZ!Box's internal answering machines

Configuring Call Diversion

1. Open the FRITZ!Box user interface.

2. Select the "Telephony / Call Handling / Call Diversion" menu.

3. Click "New Call Diversion".

4. Define which calls should be diverted.

    In the Help of the FRITZ!Box user interface you can find detailed instructions.

5. Define the destination and the type of call diversion.

6. Click "OK" to save the settings.

14.6 Dialing Rules for Outgoing Calls

If you have multiple telephone numbers, you can configure dialing rules.

A dialing rule determines which telephone number the FRITZ!Box uses for outgoing calls in a certain number range, for instance to the mobile network or abroad.

Example: You have a telephone number with which you can save on calls to foreign numbers. Then configure a dialing rule so that calls to foreign countries will be conducted with using this telephone number.

Configuring Dialing Rules

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Call Handling / Dialing Rules".

3. Click the "New Dialing Rule" button.

4. Define the range of telephone numbers or the telephone number to which the dialing rule should apply.

5. Under "Connect via", select a telephone number or connection type (Internet, fixed line).

6. Click "OK" to save the settings.

14.7 Dial Around Service Using Dialing Rules

If you would like use a dial around service number for certain calls, set up a dialing rule in the FRITZ!Box.

A dialing rule can specify, for example, that the FRITZ!Box automatically dials all international calls using a dial around service.

Entering a Dial Around Number

First enter all of the dial around service numbers you would like to use in dialing rules:

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Call Handling".

3. Switch to the "Carrier Prefixes" tab.

   If the tab is not available, the FRITZ!Box does not support the use of dial around service on your connection type.

4. Under "Additional Carrier Prefixes", enter all of the dial around service numbers you would like to use in dialing rules.

5. Click "Apply".

Configuring Dialing Rules

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Call Handling".

3. Switch to the "Dialing Rules" tab.

4. In the "Number range" list, choose for which outgoing telephone calls the dialing rule applies.

Area	Numbers Starting With
Mobile Communications	015, 016 or 017
Local area network	2, 3, 4, 5, 6, 7, 8 or 9
Long-distance calls	0

Area	Numbers Starting With
International	00
Premium numbers	0900, 0190 or 0180
Directory assistance	118

5. Select the desired dial around service number from the "Connect via... list."

6. Click "OK" to save the dialing rule.

Example: Configuring Dialing Rules for International Calls

If you would like to conduct all international calls using a dial around service, configure the dialing rules as follows:

1. Open the FRITZ!Box user interface.

2. Select "Telephony / Call Handling".

3. Switch to the "Dialing Rules" tab.

4. Select from the "Number range" list the "International" entry.

5. Select the desired dial around service number from the "connect via..." drop-down list.

6. Click "OK" to save the dialing rule.

Now whenever you call a telephone number that begins with 00 (2 zeroes) with the FRITZ!Box the call will be dialed using the dial around service number defined in the dialing rule.

14.8   Blocking Telephone Numbers and Callers

In the FRITZ!Box you can block telephone numbers for outgoing and for incoming calls.

How Does a Call Block Work?

You can configure various kinds of call blocks:

Call block for	Function
Outgoing calls	The blocked telephone number can no longer be called from the FRITZ!Box.
	Ranges of telephone numbers, for instance, mobile networks, can also be blocked.
Incoming calls	The FRITZ!Box will not accept calls from the blocked telephone number.
	However, the call block only works if the caller allows transmission of her or his telephone number.However, the call block only works if the caller allows transmission of her or his telephone number.
Anonymous callers	The FRITZ!Box will not accept any calls from callers who suppress their telephone number.

Configuring a Call Block

1.   Open the FRITZ!Box user interface.

2.   Select "Telephony / Call Handling / Call Blocks".

3.   Click the "New Blocking Rule" button.

4.   Select whether the call block is to apply to incoming or outgoing calls.

5.   Enter a range of telephone numbers or a telephone number.

6.   Click "OK" to save the settings.

14.9   Do Not Disturb

Do Not Disturb keeps a telephone from ringing at specified times. Calls you miss then appear in the FRITZ!Box call list.

Configuring Do Not Disturb

1.   Open the FRITZ!Box user interface.

2.   Select "Telephony / Telephony Devices".

3.   Click the "Edit" button [✎] to open the settings of a telephone

4.   Switch to the "Do Not Disturb" tab and configure the Do Not Disturb settings.

5.   Click "OK" to save the settings.

14.10 Alarm

When you configure an alarm, your telephone rings at the specified time.

Configuring the Alarm

1.   Open the FRITZ!Box user interface.

2.   Select "Telephony / Alarm".

3.   Enable the alarm and enter a time.

4.   Select which telephone should ring at the specified time.

5.   Define here whether the alarm should be repeated.

6.   Click "Apply" to save the settings.

The alarm is configured and enabled.

14.11 Baby Monitor

The following telephones can be configured as a baby monitor:

- FRITZ!Fon cordless telephones

- Telephones connected to the "Phone" socket on the FRITZ!Box

How Does a Telephone Work as a Baby Monitor?

You configure the telephone as a baby monitor by entering a telephone number at which you can be reached.

Now when the volume in the room reaches a certain level, the telephone will call the specified telephone number.

Incoming calls to the telephone are signaled silently.

Configuring a FRITZ!Fon Cordless Telephone as a Baby Monitor

1. Press the menu key on your FRITZ!Fon.

2. Select "Suppl. services" and then press "OK".

3. Select "Baby monitor" and then press "OK".

4. Select "Destination no." and then press "OK".

5. Enter an external telephone number, an internal telephone number or ✱✱➒ for an internal broadcast call.

   The internal numbers of the telephones you have connected are listed in telephone book of the FRITZ!Box user interface.

6. Press "OK".

7. Select "Activation" and "OK".

8. Set the sensitivity.

   The baby monitor is enabled. The display of your FRITZ!Fon shows the text "Baby monitor enabled".

To disable the baby monitor, exit the "Baby Monitor Enabled" menu.

Configuring a Telephone at the FON Port as a Baby Monitor

Here is how to configure a telephone at the "Phone" port:

1. Press the following keys on the telephone:

This Is Where the Baby Monitor Should Call	Keys
Another telephone or mobile number	**✱④①✱**‹telephone number›**#**
Internal telephone number, see page 110	**✱④①✱**‹internal telephone number without **›**#**
All other telephones connected to the FRITZ!Box (broadcast call)	**✱④①✱⑨#**

2. The baby monitor is enabled. Place the handset near the child to be monitored.

3. If the baby monitor is too sensitive, set it to a lower sensitivity. The third button defines the sensitivity. Eight levels are available:

Sensitivity	Keys
Highest	**✱④①✱**‹telephone number›**#**
	✱④②✱‹telephone number›**#**
	...
Lowest	**✱④⑧✱**‹telephone number›**#**

To disable the baby monitor, hang up the handset.

14.12 Making Telephone Calls with Convenience Functions

This chapter describes convenience functions you can use when placing and making telephone calls, for instance internal calling, forwarding calls, alternating between calls and three-party conferences.

Making Internal Calls

You can conduct free, internal calls between telephones connected to the FRITZ!Box.

1. Enter an internal telephone number on the telephone.

    The internal numbers of the telephones you have connected are listed in telephone book of the FRITZ!Box user interface.

2. Pick up the handset.

Group call

A group call or broadcast call is an internal call that is signaled on all telephones connected with the FRITZ!Box. The call is conducted with the party who picks up the telephone first.

1. Press the keys ✪✪❾ on the telephone.

2. Pick up the handset.

Transferring: Forwarding Calls Internally

Here is how to transfer a call to a different telephone:

1. While you are conducting the call, press the Hold button Ⓡ.

    The call is on hold.

2. Enter an internal number.

   The internal numbers of the telephones you have connected are listed in telephone book of the FRITZ!Box user interface.

   When the called party accepts the call the second call is connected.

3. Hang up to connect the two external parties with each other.

Defining the Telephone Number for the Next Call

Before making a telephone call you can specify whether the FRITZ!Box connects the call using the landline or a certain Internet telephone number.

Dialing rules and telephone numbers configured for the telephone are overridden for this call.

1. Press the following keys on the telephone:

Make the Call via	Keys
Landline	✱ 0 1 1 #
Internet telephone number 1 in the FRITZ!Box user interface under "Telephony / Telephone Numbers"	✱ 0 2 1 #
Internet telephone number 2	✱ 0 2 2 #
Internet telephone number 3	✱ 0 2 3 #
Other Internet telephone numbers	✱ 0 2 4 # and so on …

2. Enter the telephone number you would like to call.

3. Pick up the handset.

Calling Line Identification Restriction (CLIR) Once for Phone

For outgoing calls on the line "Phone" you can restrict identification of your calling line once (for one call).

1. Press the keys ✱❸❶⌗ on the telephone.

2. Enter the telephone number you would like to call.

3. Pick up the handset.

For this call your telephone number will not be transmitted to the other caller.

Three-Party Conference Call

Making a three-party conference call

1. Connect the first call: Call someone or pick up their call.

2. Press the Hold button ℝ.

   Call 1 is on hold.

3. Connect the second call: Enter an internal or external telephone number.

   When the called party accepts the call the second call is connected.

4. Press the keys ℝ❸.

   The three-party conference is set up.

   Any party can hang up. The two other parties remain connected.

Interrupting a Three-Party Conference Call

1. Press the keys ℝ❷.

2. You are speaking with party 1 and holding call 2.

3. Press the following keys on the telephone:

Function	Keys
Ending call 2 and switching to call 1	**R❶**
Switching between call 1 and call 2 (alternating)	**R❷**
Making a three-party conference call	**R❸**

Accepting or Rejecting Waiting Calls on Phone

Requirements

- The "Call waiting" feature must be enabled for the individual telephone in the FRITZ!Box. The telephone settings can be edited in the user interface of the FRITZ!Box under "Telephony / Telephony Devices".

Rejecting a Waiting Call

➡ Press the keys **R❶**.

Accepting a Waiting Call and Holding Call 1

1. Press the keys **R❷**.

2. Press the following keys on the telephone:

Function	Keys
Switching between call 1 and call 2 (alternating)	**R❷**
Ending call 2 and switching to call 1	**R❶**

Accepting a Waiting Call and Ending Call 1

1. Hang up.

   Call 1 is ended and your telephone rings.

2. Pick up the handset.

   You are connected with the waiting caller.

Holding, Consultation and Alternating

You can put a call on hold in order to call another party and establish a second call (consultation).

You can alternate between the two calls as often as you like.

Holding and Consultation

1. While you are conducting the call, press the Hold button **Ⓡ** on the telephone.

   Call 1 is on hold.

2. Enter an internal or external telephone number.

   When the called party accepts the call the second call is connected.

Alternating Between Calls

Here is how to switch from the active to the held call:

➡ Press the keys **Ⓡ❷**.

   The call that was just active is put on hold and you continue the other call.

Ending the Active Call—Continuing the Call on Hold

1. Hang up the handset.

   The active call is ended. Your telephone rings.

2. Pick up the handset.

   When you answer the call, you will be speaking with the party that was on hold.

Using Keypad Shortcuts

Keyboard shortcuts are commands consisting of multiple characters and numerals. They can be used to control services and features in the telephone network.

For information about which keypad sequences you can use, contact your carrier.

1. Press the keys **✪#**‹Seq›. ‹Seq› stands for a keyboard sequence.

2. Pick up the handset.

15 Configuring FRITZ!Box on the Telephone

Various functions can be configured using a telephone connected to the FRITZ!Box.

15.1 Alarm

Requirements

You set up an alarm in the FRITZ!Box; see Alarm on page 107.

Can I Switch More than One Alarm On and Off?

No. There should be no problem. With the telephone keys you always switch the first alarm on or off.

The second and third alarm can be switched on and off here:

- in the FRITZ!Box user interface; see Alarm on page 107

- in the menu of a FRITZ!Fon cordless telephone

Switching the Alarm On and Off

1. Press the following keys on the telephone:

Function	Keys
Alarm on	⊕⑧⑧❶⊛⊛
Alarm off	⊕⑧⑧❶⊕

2. Pick up the handset and hang it up again.

15.2 Do Not Disturb

You can enable the Do Not Disturb feature for the line "Phone".

ⓘ In the FRITZ!Box user interface you can also configure the Do Not Disturb function for other telephones; see Do Not Disturb on page 107.

Turning Do Not Disturb On/Off

1. Press the following keys on the telephone:

Function	Keys
Do Not Disturb enabled	✪⑧❶❶✪⓿✪
Do Not Disturb disabled	✪⑧❶❶✪❶✪

2. Pick up the handset and hang it up again.

15.3 Call Diversion

Call diversion automatically diverts incoming calls to a previously specified external telephone number.

If your telephony provider supports this, calls will be diverted by your provider. Otherwise the FRITZ!Box establishes a second connection. In either case, extra charges will accrue according to your contracted telephone rates.

Enabling: Call Diversion for All Calls

Here is how to configure call diversion to an external number (destination number) that applies to all incoming calls:

1. Press the following keys on the telephone:

Type of call diversion	Keys
Immediately	✪❷❶✪‹destination phone number›✪＃
delayed (after 20 seconds)	✪❻❶✪‹destination phone number›✪＃
only when busy	✪❻❼✪‹destination phone number›✪＃

2. Pick up the handset.

   Wait for the second-long positive acknowledgment tone.

3. Hang up the handset.

Disabling: Call Diversion for All Calls

1. Press the following keys on the telephone:

Type of call diversion	Keys
Immediately	✱②①✱✱#
delayed (after 20 seconds)	✱⑥①✱✱#
only when busy	✱⑥⑦✱✱#

2. Pick up the handset.

    Wait for the second-long positive acknowledgment tone.

3. Hang up the handset.

Enabling: Call Diversion for Own Telephone Number

You can configure call diversion that applies only for all calls that arrive for a certain telephone number. Calls for your other telephone numbers will not be diverted.

Here is how to configure call diversion to an external number (destination number):

1. Press the following keys on the telephone:

Type of call diversion	Keys
Immediately	✱②①✱‹destination phone number› ✱‹own number›#
delayed (after 20 seconds)	✱⑥①✱‹destination phone number› ✱‹telephone number›#
only when busy	✱⑥⑦✱‹destination phone number› ✱‹telephone number›#

2. Pick up the handset.

    Wait for the second-long positive acknowledgment tone.

3. Hang up the handset.

Disabling: Call Diversion for Own Telephone Number

1. Press the following keys on the telephone:

Type of call diversion	Keys
Immediately	✱❷❶✱✱‹own telephone number›⌗
delayed (after 20 seconds)	✱❻❶✱✱‹own telephone number›⌗
only when busy	✱❻❼✱✱‹own telephone number›⌗

2. Pick up the handset.

    Wait for the second-long positive acknowledgment tone.

3. Hang up the handset.

Enabling: Call Diversion for Phone

1. Press the following keys on the telephone:

Type of call diversion	Keys
immediately without ringing	⌗❹❶❶✱‹destination phone number›✱
immediately with ring	⌗❹❺❶✱‹destination phone number›✱
delayed (after 20 seconds)	⌗❹❷❶✱‹destination phone number›✱
only when busy	⌗❹❸❶✱‹destination phone number›✱

2. Pick up the handset.

    Wait for the second-long positive acknowledgment tone.

3. Hang up the handset.

Disabling: Call Diversion for Phone

1. Press the keys ✪➍⓿➊#✪✪ on the telephone.

2. Pick up the handset.

   Wait for the second-long positive acknowledgment tone.

3. Hang up the handset.

15.4 Switching the Wireless Network On and Off

1. Press the following keys on the telephone:

Function	Keys
Wireless LAN on	#➒➅✪➊✪
Wireless LAN off	#➒➅✪⓿✪

2. Pick up the handset and hang it up again.

15.5 Loading Factory Settings

All settings you made in the FRITZ!Box will be deleted.

1. Press the keys #➒➒➊✪➊➎➒⓿➊➎➒⓿✪.

2. Pick up the handset and hang it up again.

The factory settings are loaded. Then the FRITZ!Box will re-start.

16 FRITZ!Box as a Base Station for DECT Cordless Telephones

The FRITZ!Box is equipped with a DECT base station, on which you can register and configure a total of up to six DECT cordless telephones.

16.1 Paging Cordless Telephones

If you have misplaced a cordless telephone, you can find it by using a paging call:

1. Briefly press the "DECT" button of the FRITZ!Box. All cordless telephones registered on the FRITZ!Box will ring.

2. To end the paging call press the "DECT" button on the FRITZ!Box again, or any button on your cordless telephone.

16.2 Registering a Cordless Telephone

➡ Read Registering FRITZ!Fon and Other Cordless (DECT) Telephones on page 55.

16.3 Deregistering a Cordless Telephone

Deregister from the FRITZ!Box the cordless telephones you no longer use.

1. Open the FRITZ!Box user interface.

2. Select "DECT".

3. To deregister a cordless telephone, click the "Delete" ☒ button.

The cordless telephone will be deregistered from the FRITZ!Box and deleted from the user interface.

16.4　Enabling DECT Eco

DECT Eco allows the DECT radio network to be switched off during standby operation.

How Does DECT Eco Work?

When all registered cordless telephones are in standby operation, the DECT radio network of the FRITZ!Box and the telephones is switched off. When a call arrives or you press a key on a cordless telephone, the DECT radio network is switched back on.

A telephone is on standby when you are not making any calls, not using any other features, and not pressing any buttons.

Requirements

- In the user interface (see), the option "DECT Eco supported" must be displayed for each cordless telephone under "DECT / DECT Monitor".

- The FRITZ!Box must be configured as a DECT base station: The setting "DECT enabled" must be enabled under "DECT / Base Station" in the user interface.

- The following devices may **not be registered with the FRITZ!Box**: DECT-ULE devices (for instance FRITZ!DECT), FRITZ!DECT Repeater, FRITZ!Box in DECT repeater mode.

Enabling DECT Eco in the FRITZ!Box

1. Open the FRITZ!Box user interface.

2. Select the "DECT / Base Station" menu.

3. Enable the "DECT Eco" option and define when DECT Eco should be active.

4. Click the "Apply" button to save the settings.

5. Register all of the cordless telephones on the FRITZ!Box again.

17 FRITZ!Box Connects Network Devices

All network devices connected with the FRITZ!Box comprise a network. Network devices include, for instance, computers, game consoles and smartphones. The devices can be connected with the FRITZ!Box by cable or wirelessly. This chapter describes the network settings in the FRITZ!Box and how you can change them. You will also learn how you can change the IP settings for the computer in the most common operating systems.

17.1 Network Settings in the FRITZ!Box

The FRITZ!Box is delivered with preconfigured network settings. According to these settings, all network devices connected with the FRITZ!Box are located in a single network.

The network settings can be changed and adapted to your conditions and needs. But you should do so only if you are well versed in networking technology.

Home Network Overview

Under "Home Network / Network" in the FRITZ!Box user interface, all of the devices connected with the FRITZ!Box are displayed on the "Devices and Users" oder "Network Connections" tabs.

All devices

The "All Devices" tab displays all devices that are attached to the FRITZ!Box or connected with the FRITZ!Box wirelessly.

If the FRITZ!Box is being operated in IP client mode, the "All Devices" tab will not be shown.

The following devices are displayed:

- The FRITZ!Box itself

- All netwirj devices connected with the FRITZ!Box via network cable or wireless LAN. For example: computers (PCs, laptops, ...), mobile terminal devices (smartphones, tablets, ...), powerline devices, wireless repeaters, network-compatible TVs.

- All of the telephones connected with the FRITZ!Box.

- All Smart Home devices registered with the FRITZ!Box are displayed (smart plugs, radiator controls).

- All of the USB devices connected with the FRITZ!Box.

Network Connections

The "Network Connections" tab shows all network devices and users that are registered with either the home network or the guest network of the FRITZ!Box.

The overview shows the following:

- The FRITZ!Box itself.

- Network devices that have an IP connection with the FRITZ!Box. All network devices connected with the FRITZ!Box via network cable or wireless LAN.

- VPN connections that were established by FRITZ!Box users or the MyFRITZ!App.

- Windows users, if there are any Windows computers in the home network, on which the AVM Parental Controls software is installed.

Properties and Functions

- "Active Connections": Displayed here are the network devices that have an active connection to the FRITZ!Box and active VPN connections.

- "Unused Connections": Displayed here are the network devices that are registered with the FRITZ!Box, but which currently have no active connection to the FRITZ!Box. VPN connections that are currently inactive are also displayed here.

- Detailed View: You can open a detailed view for each entry in the overview. In the detailed view you can make changes to th settings of the network device, the VPN connection, or the Windows user.

- Deregistering network devices: You can remove devices from the overview and thus deregister them from the FRITZ!Box.

- Deregistering multiple network devices: You can remove multiple network devices from the overview at once and thus deregister them from the FRITZ!Box.

- Entering/Including network devices: You can include network devices in the overview even when they cannot be reached by the network signals.

Network Devices: Settings

The settings described in the following section can be configured for each network device individually.

Always Assigning the Same IP Address

For network devices there is the setting "Always assign this network device the same IP address".

This setting has the effect that the DHCP server of the FRITZ!Box will assign the same IP address to the device every time it connects to the network.

Starting the Computer—Wake on LAN

Wake on LAN is a function that allows a computer in the local network to be started when it is accessed from the Internet. For instance, you can access a computer using remote maintenance software, without keeping the computer switched on permanently.

The FRITZ!Box supports Wake on LAN both for IPv4 and for IPv6 connections.

Requirements:

- The computer must support Wake on LAN.

- The computer must be connected with the FRITZ!Box via network cable or via a FRITZ!Powerline device.

- For access from the Internet, the computer must be in standby operation.

There are two ways to start the computer:

- The "Start Computer" button

  Using this button you can start the computer every time it is accessed from the Internet.

- Starting automatically

  With the "Start this computer automatically as soon as it is accessed from the Internet" option the computer is started automatically when it is accessed from the Internet.

Configuring Settings

The settings are configured in the detailed view of the individual network devices:

1. Select the "Home Network / Network" menu.

2. Select the "Devices and Users" tab.

3. Select the computer and click the "Edit" button:

The detailed view for the computer will be opened.

IPv4 Settings in the FRITZ!Box

Factory Settings

The following IPv4 settings are preconfigured in the FRITZ!Box upon delivery:

Setting	Preconfigured value
IPv4 address	192.168.178.1
Subnet mask	255.255.255.0
DHCP server	enabled

The following IP addresses can be derived from the IP address and the subnet mask:

IPv4 addresses	Value
Network address	192.168.178.0
Entire IPv4 address range for the computers	192.168.178.2 – 192.168.178.254

Reserved IP Addresses

The following IPv4 addresses cannot be assigned because they are reserved for certain purposes:

Purpose of the IPv4 Address	Value
This IP address is used by the FRITZ!Box itself	192.168.178.1
This IP address is the broadcast address used to send messages into the network	192.168.178.255

The following IPv4 address ranges are reserved for certain purposes. If you would like to use IPv4 addresses from these ranges for other purposes, then make sure to avoid address conflicts:

Intended Use of the Address Range	
address range reserved for the DHCP server	192.168.178.20 – 192.168.178.200
for FRITZ!Box users with VPN authorization	192168178201 – 192.168.178.254

Changing the IPv4 Address

In most home networks it is not necessary to change the IPv4 settings.

Yet there are situations in which it makes sense to adjust the IPv4 settings of the FRITZ!Box. For instance, in the following case:

- You have an existing local IPv4 network, one subnet with several computers.

- Fixed IPv4 addresses are registered in the network settings of the computer, and you do not want to or are not permitted to change these addresses.

- You want to connect the FRITZ!Box to the local IPv4 network in order to make the FRITZ!Box features available to all of the computers in the IPv4 network.

Guest Network

If the guest access is configured in the FRITZ!Box, the guest network has its own IP network assigned automatically by the FRITZ!Box. The IP addresses of the guest network are not available for other purposes.

The IP address of the guest network can be found in the user interface of the guest network, under "Home Network / Home Network Overview / Network Settings / IPv4 Addresses".

Subnetworks

The FRITZ!Box also supports subnets that are not pure class A, B, or C networks. This means you can enter any subnet mask you like. The smallest subnet mask allowed is 255.255.255.252.

IPv4 Address in Case of Emergency

The FRITZ!Box has a fixed IPv4 address that cannot be changed. The FRITZ!Box always can be reached at this IPv4 address.

Emergency IPv4 address	169.254.1.1

For instructions about how to handle the emergency IPv4 address, see the section Opening the User Interface Using an Emergency IP Address from page 172.

DHCP Server for IPv4

The FRITZ!Box has a DHCP server for the IPv4 range. The DHCP server is enabled by default in the factory settings. The following range of IP addresses is reserved for the DHCP server in the factory settings:

IP address range reserved upon delivery	192.168.178.20 – 192.168.178.200

How the DHCP Server Works

Every time a network device connected with the FRITZ!Box is started, the DHCP server assigns it an IPv4 address from the IP address range of the DHCP server.

Only one DHCP server may be active within any network.

Assigning the IP addresses via the DHCP server ensures that all of the network devices connected with the FRITZ!Box are located in the same IP network.

The IPv4 settings of the network devices must have the "Obtain an IP address automatically" option enabled. This is the only way to receive the IP address from the DHCP server. For more information, see the chapter Obtaining an IP Address Automatically from page 131.

Fixed IPv4 Addresses When the DHCP Server Is Enabled

If you would like to configure fixed IPv4 addresses on individual computers connected with the FRITZ!Box even though the DHCP server is enabled, please note the following:

- The IPv4 addresses must be from the IPv4 network of the FRITZ!Box.

- The IPv4 addresses may not come from the address range of the DHCP server.

- Each IPv4 address can be assigned only once.

Changing the IP Address Range of the DHCP Server

If the DHCP server does not have enough IP addresses, you can expand the address range.

Disabling the DHCP Server

You can disable the DHCP server of the FRITZ!Box.

- If you use a different DHCP server in your home network, you must disable the DHCP server of the FRITZ!Box.

- If you want to manage the IP address assignments of all devices in the home network yourself, you can disable the DHCP server of the FRITZ!Box.

Please note that the FRITZ!Box must be located in the same IP network as all of the device connected with it. Integrate the FRITZ!Box in your network by adjusting the IP address of the FRITZ!Box to your home network.

IPv6 Settings in the FRITZ!Box

Switch to the advanced view; see Standard View and Advanced View on .

The following settings options are configured in the "Home Network / Network" menu on the "Network Settings" tab.

Additional IPv6 Routers in the Home Network

- IPv6 prefixes from other IPv6 routers

  You can allow the network devices connected to the FRITZ!Box to receive IPv6 prefixes announced by other IPv6 routers in the local network.

- Also announce DNSv6 server via router advertisement

  With this setting you specify that the FRITZ!Box announces the local DNSv6 server in the local network via router advertisement. Alternatively, the network devices can identify the local DNSv6 server via DHCPv6.

IPv6 Settings

Click the "IPv6 Addresses" button to configure settings for the IPv6 addresses in the local network.

Unique Local Addresses

Communication within the local network takes place via the Unique Local Addresses (ULA). If no IPv6 Internet connection is established, the network devices do not have a ULA and communication between them is restricted. For this case you can set the FRITZ!Box such that the network devices receive the ULA from the FRITZ!Box.

DHCPv6 Servers in the Home Network

The FRITZ!Box is equipped with its own DHCPv6 server. The DHCPv6 server of the FRITZ!Box is switched on by default.

The DHCPv6 server assigns the network devices their IPv6 settings. These settings are used instead of the data in the router advertisement messages. The DNS server, IPv6 prefixes or IPv6 addresses can all be assigned by DHCPv6. Define which IPv6 settings should be assigned by the DHCPv6 server.

Changing Network Settings

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Home Network / Network" menu.

4. Select the "Network Settings" page.

5. Click the "IPv4 Addresses" or "IPv6 Addresses" button, depending on the address range you would like to change.

Note that changes to the network settings in the FRITZ!Box may make it necessary to adjust the network settings of your computers so that you can continue to access the FRITZ!Box user interface.

UPnP Settings

The Universal Plug-and-Play (UPnP) service included in your FRITZ!Box provides status information about the FRITZ!Box to all connected computers. UPnP-compliant programs on these computers can receive this information and use it to display the status of the FRITZ!Box (e.g., connection status, data transmission). UPnP service thus allows you to monitor your FRITZ!Box from a connected computer.

Here is how to change the UPnP settings:

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Home Network / Network" menu.

4. Select the "Network Settings" tab.

5. Configure the UPnP settings in the "Access Settings in the Home Network" area.

17.2 Obtaining an IP Address Automatically

The FRITZ!Box has its own DHCP server, which assigns IP addresses to the connected computers. The connected computers must be configured such that they can receive their IP addresses automatically. The steps for checking and adjusting this option differ among the operating systems. See the relevant section for your operating system.

If FRITZ!Box is operated in a network, no other DHCP server may be activated in this network.

Obtaining an IP Address Automatically in Windows

1. In Windows 10 and 7 click "Start".

   In Windows 8, press the Windows key and the Q key at the same time.

2. Enter "ncpa.cpl" in the search field and press Enter.
3. Click the network connection between the computer and the FRITZ!Box with the right mouse button and select "Properties".

4. Under "This connection uses the following items", select "Internet Protocol Version 4 (TCP/IPv4)".

5. Click the "Properties" button.

6. On the "General" tab, enable the options "Obtain an IP address automatically" and "Obtain DNS server address automatically".
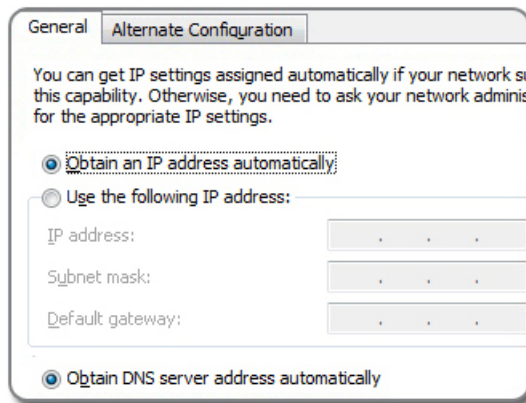

7. Click "OK" to save the settings.

8. Enable the options "Obtain an IP address automatically" and "Obtain DNS server address automatically" for the Internet protocol version 6 (TCP/IPv6) as well.

The computer receives an IP address from the FRITZ!Box.

Obtaining an IP Address Automatically in Mac OS X

1. Select the "System Preferences" in the Apple menu.

2. In the "System Preferences" window, click the "Network" icon.

3. In the "Network" window, select the "Ethernet" entry from the"Show:" list.

4. Click the "Advanced..." button. The "TCP/IP" settings page opens. Select the "Using DHCP" option from the "Configure IPv4:" drop-down list.

5. Click "OK".

The computer now receives an IP address from the FRITZ!Box.

Obtaining an IP Address Automatically in Linux

For comprehensive information and tips on network settings in Linux, see, for example:

www.tldp.org/HOWTO/NET3-4-HOWTO-5.html

18 Connecting USB Devices to the FRITZ!Box

The FRITZ!Box has two USB ports to which you can connect various USB devices. All network devices in the FRITZ!Box home network can use these USB devices jointly and simultaneously.

This chapter describes how to share a printer in the network, which USB devices can be used in your FRITZ!Box home network, and how to use these devices safely.

18.1 Power Supply for USB Devices

You can connect USB devices with the following properties to the FRITZ!Box:

* Some USB devices require more than one USB port for operation, for instance, hard drives with a USB Y cable. Connect this type of USB device to the FRITZ!Box using a USB hub with its own power supply.

* The total current consumption of connected USB devices without their own power supply may not exceed 500 mA. Check the rating plates of the connected USB devices.

  USB devices that exceed the total current consumption of 500 mA can be connected to the FRITZ!Box using a USB hub with its own power supply.

18.2 USB Devices on the FRITZ!Box

These USB devices can be connected to the FRITZ!Box:

* You can connect up to four USB storage media like hard disks, USB flash drives or card readers.

* USB storage media must use the file systems EXT2, FAT, FAT32 or NTFS. On storage media with the FAT and FAT32 file systems you can use files up to a size of 4 GB. In the EXT2 and NTFS file systems there is no limit to the size of files that can be used.

- You can connect **one** standard USB printer or **one** all-in-one device with scanner and fax function.

  The complete range of functions available in all-in-one printers is guaranteed only with the USB remote connection of the FRITZ!Box; see Sharing a USB Printer on page 137.

- You can connect a USB hub to the FRITZ!Box and use up to four USB devices at this hub.

  You can use USB hubs with or without a separate power supply. We recommend deploying a USB hub with its own power supply if the USB devices to be connected exceed a total current consumption of 500 mA; see Power Supply for USB Devices on page 134.

- You can connect a USB modem. With a USB modem the FRITZ!Box can establish the Internet connection via the mobile communications network (LTE/UMTS/HSPA); see Configuring the Internet Connection for a Mobile Network on page 51.

18.3   Using USB Devices Safely

Follow the instructions below about how to use USB devices on your FRITZ!Box.

- The FRITZ!Box can not defend the USB memory from external influences. This means that voltage spikes or drops, like those that occur during electrical storms, may lead to data losses on connected USB storage media. We recommend making regular backups of the USB memory contents to avoid any losses.

- Whenever you want to remove USB devices from the FRITZ!Box, go to the "Home Network / USB Devices" area in the FRITZ!Box user interface to remove them safely and avoid any loss of data.

18.4 Accessing USB Memory

The participants in the home network have various possibilities for accessing the various storage media of the FRITZ!Box.

- Participants in the home network can use FTP software like FireFTP to exchange files among the FRITZ!Box storage media and workplaces.

  Alternatively, you can enter ftp://fritz.box in the address line of your Internet browser to access the storage media.

  If you would like to use FTP software, see the documentation of the software as well as the instructions in the Help on the FRITZ!Box user interface.

- For access to media data like music, images and videos available on the memory or on storage media of the FRITZ!Box you can enable the FRITZ!Box media server. Suitable playback devices like TV sets, web radios, smartphones and the Windows Media Player can then call up the data from the media server for streaming.

  Playback devices to be used in connection with the media server must support the UPnP AV standard. The term "DLNA" is often used to designate this support.

  Enable the "Media Server enabled" function in the FRITZ!Box user interface under "Home Network / Media Server".

18.5 Enable energy-saving mode for USB hard drives

In the FRITZ!Box you can enable an energy-saving function for USB hard drives connected to the FRITZ!Box. When the energy-saving function is enabled, connected USB hard drives will be switched off when they are idle—as long as the hard drives support the energy-saving function.

Enable the energy-saving function in the "Home Network / USB Devices" menu in the FRITZ!Box user interface. You can also test here whether your USB hard disk supports the energy-saving function.

18.6   Sharing a USB Printer

You can connect a USB printer to the FRITZ!Box to make it available to all participants in your home network.

Using a USB Printer: Possibilities

A USB printer connected to the FRITZ!Box can be configured in various ways:

Type of Configuration	Your device is a
network printer	• A printer that is to be used simultaneously and jointly by the participants in the home network. • A printer that is to be used by computers that use an operating system other than Windows.
Printer with FRITZ!Box USB remote connection	• An all-in-one device (fax/printer/scanner) and the entire range of functions is to be used. • A printer with convenience features like ink level display, which are to be used. • A printer that uses bidirectional data exchange. In other words: Not only does the computer send data to the printer, the printer also sends status messages to the computer. This communication in both directions is typical of "Windows printers" or "GDI printers" that work only with special Windows device drivers.

Configuring a USB Printer as a Network Printer

Connect the USB printer to the USB port of the FRITZ!Box.

Preparing Configuration

1.   Open the FRITZ!Box user interface.

2.   Enable the advanced view.

3.   Select the "Home Network / USB Devices" menu.

4. Select the "USB Remote Connection" tab.

5. Make sure that the option "printers (including all-in-one printers)" is disabled.

6. Save your settings by clicking "Apply".

7. Connect the USB printer to the FRITZ!Box.

This concludes the preparations. Continue reading in the section for your operating system.

Setting Up a USB Printer in Windows 10

1. Press the keyboard shortcut "Windows key+X" and select "Control Panel" from the context menu.

2. Click "Hardware and Sound" and select "Devices and Printers".

3. In the menu bar, click "Add a printer".

4. Click "The printer that I want isn't listed" in the window "Choose a device or printer to add to this PC".

5. Enable the option "Add a printer using TCP/IP address or hostname" and click "Next".

6. Enter "fritz.box" in the Hostname or IP address: field.

    If the FRITZ!Box is configured as a wireless repeater or an IP client, enter here the IP address at which the FRITZ!Box can be reached within the network.

7. Click "Next".

8. Select the printer manufacturer and model.

    If the printer is not displayed, you must first install the printer drivers for this device. Consult the documentation of your printer for instructions.

9. Click "Next".

10. If the "Printer Sharing" window appears, select "Do not share this printer" and click "Next".

11. Click "Finish".

The USB printer has been configured and can be used as a network printer.

Setting Up a USB Printer in Windows 8

1. Press the keyboard shortcut "Windows key+X" and select "Control Panel" from the context menu.

2. Click "Hardware and Sound" and select "Devices and Printers".

3. In the menu bar, click "Add a printer".

4. In the "Add Printer" window, select "The printer that I want isn't listed" and then "Next".

5. Enable the option "Add a printer using TCP/IP address or hostname" and click "Next".

6. Enter "fritz.box" in the Hostname or IP address: field.

    If the FRITZ!Box is configured as a wireless repeater or an IP client, enter here the IP address at which the FRITZ!Box can be reached within the network.

7. Click "Next".

8. Select the printer manufacturer and model.

    If the printer is not displayed, you must first install the printer drivers for this device. Consult the documentation of your printer for instructions.

9. Click "Next" and confirm with "Finish".

The USB printer has been configured and can be used as a network printer.

Setting Up a USB Printer in Windows 7

1. Click "Start" and then "Devices and Printers".

2. In the menu bar, click "Add a printer".

3. In the "Add Printer" window, select the "Add a network, wireless or Bluetooth printer" option and then click "Next".

4. Click "The printer that I want isn't listed."

5. Enable the option "Add a printer using TCP/IP address or hostname" and click "Next".

6. As the "Device Type", select "Automatic detection" and enter in the input field "Host name or IP address": fritz.box.

   If the FRITZ!Box is configured as a wireless repeater or an IP client, enter here the IP address at which the FRITZ!Box can be reached within the network.

7. Click "Next". Windows attempts to detect the TCP/IP port.

8. If Windows reports "Additional port information required", select "Custom" as the device type and then click "Next".

9. Select the printer manufacturer and model.

   If the printer is not displayed, you must first install the printer drivers for this device. Consult the documentation of your printer for instructions.

10. Click "Next" and confirm with "Finish".

The USB printer has been configured and can be used as a network printer.

Configuring a USB Printer in Mac OS X Version 10.5 or Higher

1. In the dock, click "System preferences".

2. Click "Print & Fax".

3. Click the "+" sign.

4. Click "IP Printer".

5. In the "Protocol:" drop-down list, select the entry "HP Jet Direct – Socket".

6. Enter fritz.box in the "Address:" input field.

   If the FRITZ!Box is configured as a wireless repeater or an IP client, enter here the IP address at which the FRITZ!Box can be reached within the network.

7. In the "Print Using:" drop-down list, select the printer that is connected to the USB port of your FRITZ!Box.

   If the printer is not displayed, you must first install the printer drivers for this device. Consult the documentation of your printer for instructions.

8. Click "Add" or "Add Port...".

The USB printer has been configured and can be used as a network printer.

Configuring a USB Printer in Other Operating Systems

The names of entries or menus in operating systems not described above may be slightly different than the terms we use here.

- As the port type, select "Raw TCP".

- Enter "9100" as the port.

- Enter fritz.box as the printer name.

If the FRITZ!Box is configured as a wireless repeater or an IP client, enter here the IP address at which the FRITZ!Box can be reached within the network.

Configuring a USB Printer with FRITZ!Box USB Remote Connection

If you are using an all-in-one device or would like to use the convenience features of a USB printer connected to the FRITZ!Box, we recommend installing the FRITZ!Box USB remote connection software. The FRITZ!Box USB remote connection program can be installed on computers with Windows 10, Windows 8 or Windows 7 (32- and 64-bit).

Installing FRITZ!Box USB Remote Connection

Install the program for FRITZ!Box USB remote connection on all of the computers with which you want to use the connected USB device.

1. Connect the USB printer to the USB port of the FRITZ!Box.

2. Open the FRITZ!Box user interface.

3. Enable the advanced view.

4. Select the "Home Network / USB Devices / USB Remote Connection".

5. Click the "USB remote connection software" link.

6. In the "USB Remote Connection" window, click "Download".

7. Download the file "fritzbox-usb-fernanschluss.exe".

8. Double-click the file and follow the instructions on your screen.

The FRITZ!Box USB remote connection software is now installed on your computer. Repeat the steps in these instructions for all other Windows users who wish to use the USB remote connection on this computer.

Enabling the FRITZ!Box USB Remote Connection

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select the "Home Network / USB Devices / USB Remote Connection".

4. Enable the USB remote connection for printers and select the option "printers (including all-in-one printers)".

   For an all-in-one printer with a memory function, also enable the "USB storage media" option.

   For an all-in-one printer with a scanner function, also enable the "others (e.g. scanner)" option.

5. Click "Apply".

The FRITZ!Box USB remote connection is enabled.

Using a USB Printer with FRITZ!Box USB Remote Connection

1. Open the FRITZ!Box USB remote connection by clicking the icon in the Windows task bar.

2. Enter the FRITZ!Box password in the "My FRITZ!Box" area.

3. Click "Refresh".

4. Click the USB printer in the "Devices" area.

The USB printer is being connected to the computer.

Do not conduct any firmware updates for USB devices that are connected with the computer via the FRITZ!Box USB remote connection.

19 Extending the Scope of Functions with Smart Home

You can expand the scope of functions of your FRITZ!Box with AVM smart home devices for home automation.

A smart home device that is especially easy to integrate in your home network is FRITZ!DECT 200. FRITZ!DECT 200 is a switchable socket that lets you control the power supply to connected devices, and measure, record and evaluate their power consumption. FRITZ!DECT 200 is integrated with your FRITZ!Box via DECT radio transmission and can then be controlled with the computer, smartphone or tablet, from home or anywhere else with Internet access.

Comprehensive information on smart home solutions is presented in the "Guide" area on the AVM website.

en.avm.de/guide

20 Configuring Internet Access for Guests

With the FRITZ!Box you can provide houseguests with an Internet connection of their own. At this guest access they can surf the web with their own devices, but cannot access the contents of your home network.

20.1 Requirements

The guest access in the FRITZ!Box can be configured and provided only if the FRITZ!Box establishes the Internet connection itself.

If the FRITZ!Box is operated as an IP client, no guest access can be configured.

20.2 Wireless Guest Access: Private Hotspot

For your guests you can configure a wireless guest access. The wireless guest access is your private hotspot.

Features of the Wireless Guest Access

- At the wireless guest access your guests can log in with their own smartphones, tablets, laptops or other network devices.

- Guest devices can surf the Internet.

- Guest devices have no access to your home network.

- The guest access can be disabled automatically.

- There is an option that guest devices must consent to the terms of use of the guest access upon registration.

- The guest access can use push service to notify you about all devices registering and deregistering.

- The access profile "Guest" is set for the wireless guest access. This access profile can be edited in the "Internet / Filters" menu on the "Access Profiles" tab.

Configuring Wireless Guest Access

1. Open the FRITZ!Box user interface.

2. Select the "WLAN / Guest Access" menu and enable guest access.

3. Assign a name for the guest wireless network (SSID) and enter a network key under "Security".

This concludes the configuration of your guest access. Now guests can register their wireless devices with the FRITZ!Box.

Manually Registering a Wireless Device with the Wireless Guest Access

1. Your guest starts the wireless LAN software of her or his wireless device and searches for the guest network.

2. Your guests authorize themselves using the network key you assigned.

The wireless LAN connection will be established.

Registering a Wireless Device with the Wireless Guest Access via QR Code

1. Print out the QR code for your guest.

2. Your guest starts the QR code reader on his or her wireless device and reads in the QR code of the wireless network.

The wireless LAN connection will be established.

Registering a Wireless Device with the Wireless Guest Access via WPS

1. Your guest starts WPS on his or her wireless device.

2. In the "WLAN / Guest Access" menu, click the "Start WPS" button.

The wireless LAN connection will be established.

20.3   Configuring Guest Access on the LAN 4 Port

For guests you can configure the network port "LAN 4" as a guest access.

Features of the LAN Guest Access

- Guests can connect their laptops to the guest access with a network cable.

- Guest devices can surf the Internet.

- Guest devices have no access to the home network.

- The access profile "Guest" is set for the LAN guest access. This access profile can be edited in the "Internet / Filters" menu on the "Access Profiles" tab.

Configuring Guest Access

Set up the guest access as follows:

1. Open the FRITZ!Box user interface.

2. In the "Home Network / Network" menu, select the "Network Settings" tab.

3. In the "Guest Access" area, check the box in front of the "Guest access enabled for LAN 4" option.

4. Click "Apply".

21 MyFRITZ!: Accessing the FRITZ!Box from Anywhere

21.1 Configuring MyFRITZ!

The MyFRITZ! service can be used only with a MyFRITZ! account. Register your FRITZ!Box with this MyFRITZ! account.

Once your FRITZ!Box is registered with your MyFRITZ! account, the FRITZ!Box determines the public IP address each time it is changed and conveys it to the MyFRITZ! account. The FRITZ!Box can be reached at this IP address in the Internet from anywhere in the world. When you log in to MyFRITZ! you will be forwarded to the FRITZ!Box using the IP address.

Creating a MyFRITZ! Account

Overview

A MyFRITZ! account is required in order to be able to use My-FRITZ!.

Requirements

- The computer is connected with the Internet.

- You can access your e-mail on this computer.

Rules

Comply with the following rules when assigning a password for your MyFRITZ! account:

- Your MyFRITZ! password must be different from the password of your FRITZ!Box user account.

- Use a password rated as secure.

- Select a password with at least twelve characters, which includes capitals and lower-case letters as well as numerals and special characters.

- Be sure to keep your passwords in a safe place!

Creating a MyFRITZ! Account

1. Open the FRITZ!Box user interface.

2. Select "Internet / MyFRITZ!".

3. Select "Create a new MyFRITZ! account".

4. Enter your e-mail address. If you are already configured as a FRITZ!Box user, enter here the e-mail address you use for the FRITZ!Box user account.

5. Assign a MyFRITZ! password. This password must be different from the password for your FRITZ!Box account.

6. If you do not have a user account yet, you will be prompted to set one up by assigning a user name and an additional password. If you already have a FRITZ!Box user account, follow the instructions in the FRITZ!Box user interface.

7. You receive an e-mail from MyFRITZ! containing a registration link. If possible, open the e-mail on the computer on which you began setting up the account. Click the registration link.

8. You are forwarded to the MyFRITZ! website to activate the account. After successful activation, you will end up back on your FRITZ!Box user interface.

21.2 Using MyFRITZ!

As soon as you have created a MyFRITZ! account and registered your FRITZ!Box with the account, you can begin using the MyFRITZ! service to access your FRITZ!Box directly.

You can reach your FRITZ!Box from anywhere by opening the myfritz.net website in any web browser.

If you use a smartphone or a tablet, the MyFRITZ!App from AVM offers you simple access to your FRITZ!Box at home.

MyFRITZ! in the Web Browser

1. Open the myfritz.net website.

2. Log in with your e-mail address and your MyFRITZ! password.

3. Click the "To My FRITZ!Box" button.

4. To register with your FRITZ!Box, enter the data of your FRITZ!Box user account.

You will be directed to the MyFRITZ! page of your FRITZ!Box.

Here you have access to the FRITZ!Box functions that are released for sharing in your user account; see .

MyFRITZ! over a Smartphone or Tablet

With the MyFRITZ!App from AVM you can use the MyFRITZ! service on the following devices:

• Android smartphones or Android tablets with Google Android 2.2 or later

• iPhone, iPod touch or iPad with iOS 5.0 or later

The MyFRITZ!App is available in the Google Play Store and the Apple App Store.

For more information on the apps from AVM, go to en.avm.de/products/fritzapps.

During configuration, your smartphone or tablet must be connected with the FRITZ!Box over wireless LAN. After setup you can use the MyFRITZ!App no matter whether you're at home or on the go.

1. Load the MyFRITZ!App to your device.

2. Connect your smartphone or tablet with your FRITZ!Box via wireless LAN.

3. Open the MyFRITZ!App.

4. To register with your FRITZ!Box, enter the data of your FRITZ!Box user account. These are your e-mail address or your FRITZ!Box user name plus the corresponding password.

You will be directed to the MyFRITZ! page of your FRITZ!Box.

Here you have access to the FRITZ!Box contents that are released for sharing in your FRITZ!Box user account; see .

MyFRITZ! in the Home Network

MyFRITZ! can also be used over the web browser of any device in the home network that is connected with the FRITZ!Box.

1. Enter http://myfritz.box in the address field of your web browser.

2. Log in to your FRITZ!Box.

    Depending on the login method you set for the home network, you must enter the FRITZ!Box password, or the user name and the password of the FRITZ!Box user account.

You will be directed to the MyFRITZ! page of your FRITZ!Box. In this case no login to MyFRITZ! is required.

If you logged in with the FRITZ!Box password, you now have access to all of the contents stored on your FRITZ!Box.

If you logged in using the information for your FRITZ!Box user account, the MyFRITZ! page will show those contents of your FRITZ!Box to which you have access rights.

Multiple FRITZ!Boxes

You can register multiple FRITZ!Boxes with one MyFRITZ! account.

*   Every FRITZ!Box is registered with the MyFRITZ! account over its own user interface.

    From the "Internet / MyFRITZ!" menu, select the setting "Register the FRITZ!Box with an existing MyFRITZ! account".

*   When you log in to MyFRITZ!, all registered devices will be displayed.

21.3   Security with MyFRITZ!

For the following MyFRITZ! activities the HTTPS security protocol is used:

- setting up a MyFRITZ! account with myfritz.net

- registration of the FRITZ!Box with the MyFRITZ! account

- accessing the MyFRITZ! page of your FRITZ!Box over myfritz.net

- accessing the user interface of the FRITZ!Box over myfritz.net and over the MyFRITZ!App.

The FRITZ!Box generates its own HTTPS certificate. Because this certificate does not come from a certification authority preconfigured in common browsers, you have to confirm in your web browser or in the MyFRITZ!App that the connection should be established nevertheless. Firefox and Internet Explorer will remember your confirmation and refrain from showing any further warnings.

The HTTP protocol is used to update the IP address with the MyFRITZ! web service each day. The password is never transmitted as clear text.

For further details on the HTTPS and HTTP protocols, see the section Access from the Internet via HTTPS, FTP and FTPS from page 73.

22 Push Services: Using Notification Services

Push services are notification services that inform you about the activities of your FRITZ!Box and assist you in saving your passwords and FRITZ!Box settings. With the push services you can have e-mail sent to you at regular intervals informing you about the latest connections, usage and configuration of your FRITZ!Box.

Various push services are available in the user interface under "System / Push Service". There you can select the push service interesting for you and specify which events in the FRITZ!Box you would like to be informed about, how often these e-mails should be sent, and to which e-mail address.

22.1 Available Push Services

You can request push service mails about the following FRITZ!Box areas and activities:

Push Service	Information
FRITZ!Box info	Sends you regular e-mail messages with data on FRITZ!Box usage and connections.
Answering machine	Forwards recorded messages on the FRITZ!Box answering machines to the specified e-mail address.
Calls	Sends you e-mail when calls arrive—either only for missed calls, or for all calls.
Wireless Guest Access	Sends you a message whenever devices register with or deregister from the wireless LAN guest access.
Fax function	Forwards your faxes by e-mail and also saves them to a storage location you defined.
New FRITZ!OS	Notifies you whenever a new FRITZ!Box is available for your FRITZ!OS.

Push Service	Information
Save Settings	The settings of your FRITZ!Box are saved automatically and sent to the specified e-mail address before every update and each time the factory settings are restored.
Forgot password	Sends you an access link to the specified e-mail address if you have forgotten your password.
Current IP address	Sends the IP address assigned by the Internet service provider every time the Internet connection is established.
Change Notice	Notifies you by e-mail about changes to the FRITZ!Box settings and about security-relevant events.

22.2 Enabling Push Services

A wizard is available in the FRITZ!Box user interface to guide you step by step through the configuration of push services.

1.   Open the FRITZ!Box user interface.

2.   On the "Overview" page, select the "Wizards" menu.

3.   Start the "Configure Push Service" Wizard. The wizard guides you through the menus and dialogs to enable the push services.

22.3 Configuring Push Services

You can adjust the push services to your needs, and also disable any or all push services.

1.   Open the FRITZ!Box user interface.

2.   Select the "System / Push Service / Push Services" menu.

3.   To configure a push service, click the "Edit" button.

4. Configure various settings in the details.

   The Help of the FRITZ!Box user interface presents comprehensive information on the settings of each push service.

5. Click "OK" to save your settings.

In the Help of the FRITZ!Box user interface you can find detailed instructions.

23 Diagnostics: Checking Function and Security

In the "Diagnostics" area the FRITZ!Box offers you the possibility of checking the status of functions and security-relevant settings of your FRITZ!Box. This ensures safe operation of the FRITZ!Box and makes sure that it is kept up with the latest technical developments.

23.1 Checking FRITZ!Box Functions

With the function diagnosis you can get an overview of the functional status of your FRITZ!Box, its Internet connection and the devices in your home network. In the case of an error the diagnostics results can help you localize and remedy any problems.

Starting the Function Diagnosis

1. Open the FRITZ!Box user interface.

2. Select "Diagnostics / Function".

3. Click "Start" to start the diagnostics.

The diagnostics run through the various test areas.

For more information on test areas and test items, as well as on the icons and information in the result of the diagnostics, see the Help on the FRITZ!Box user interface.

Canceling Diagnostics

You can end diagnostics in progress without losing any data.

➡ To end a diagnostics run, click "Cancel".

The results obtained up to that point remain visible.

23.2 Checking the Security of the FRITZ!Box

In the "Security" overview the FRITZ!Box offers you a list of all security-relevant settings that control access to the FRITZ!Box from the Internet or from the home network. This shows, for instance, which ports are open, which users are logged in on or off the FRITZ!Box, which wireless devices are connected with the FRITZ!Box and whether the latest FRITZ!OS is installed.

The "Security" overview also offers the following functions:

- It indicates configured settings that the security diagnostics classify as insecure.

- From the test entries in the "Security" overview you can navigate directly to the relevant settings.

- Help is available for each test entry.

- You can print the results of the security diagnostics.

The "Security" overview is located in the "Diagnostics / Security" menu in the FRITZ!Box user interface.

Comprehensive information on the subject of "Security" is presented in the "Guide" area on the AVM website:

en.avm.de/guide

24 Saving and Restoring Settings

All of the settings you configure in the FRITZ!Box can be saved in a backup file. With this file you can restore your settings at any time:

- in the same FRITZ!Box or another FRITZ!Box of the same model
- in a different FRITZ!Box model.

  In this case you can select which settings are to be applied to the FRITZ!Box.

24.1 Saving Settings

Backup files that are not protected by assigning a password are a security risk. Protect your backup file with a password to avoid security problems.

A wizard is available in the FRITZ!Box user interface to assist you in saving your FRITZ!Box settings, which guides you through the process step by step.

1. Open the FRITZ!Box user interface.

2. Select "Wizards".

3. Start the "Save and Restore Settings" Wizard.

4. In the next window, select the "Save settings" option and then click "Next".

The wizard guides you through the menus and dialogs to save your settings.

24.2   Restoring Settings

With the "Restore" function in the "System / Backup" you can have all settings from a backup file you created with this or another FRITZ!Box loaded to your FRITZ!Box. Your current FRITZ!Box settings will be overwritten by this function.

You can use the following backup files to restore settings:

- Backup files created with the same FRITZ!Box.

  If you apply settings from a backup file created with the same FRITZ!Box, all settings will be restored in full.

- Backup files created with a different FRITZ!Box of the same model.

  If you apply settings from a backup file that was created with a different FRITZ!Box of the same model, you can restore all settings if the backup file was protected with a password.

- Backup files created with a different FRITZ!Box model.

  If you apply settings from a backup file that was created with a FRITZ!Box of a different model, then you can restore several selected settings to your FRITZ!Box.

A wizard is available in the FRITZ!Box user interface to assist you in restoring your FRITZ!Box settings, guiding you through the process step by step.

1.   Open the FRITZ!Box user interface.

2.   Select "Wizards".

3.   Start the "Save and Restore Settings" Wizard.

   Your current FRITZ!Box settings will be overwritten by the settings in the backup file.

4.   In the next window, select the "Restore settings" option and then click "Next".

The wizard guides you through the menus and dialogs to restore your settings.

24.3   Restarting the FRITZ!Box

You can restart the FRITZ!Box via the user interface or on the device. A restart may be necessary if the FRITZ!Box no longer reacts, or if Internet connections can no longer be established for no apparent reason. All components of the FRITZ!Box are reinitialized and the event messages deleted.

The FRITZ!Box settings and any messages saved on the internal memory of the FRITZ!Box will not be deleted upon restarting.

Restarting from the User Interface

1.   In the "System / Backup" menu, click the "Restart" tab.

2.   Click the "Restart" button.

    Restarting the FRITZ!Box takes about 2 minutes. During this time, you cannot access the FRITZ!Box user interface.

After the restart you will be automatically redirected to the "Overview" page of the FRITZ!Box.

Restarting on the Device

If you cannot open the FRITZ!Box user interface, it is also possible to restart directly on the FRITZ!Box device.

1.   Remove the power supply of the FRITZ!Box from the electrical outlet.

2.   Wait 5 seconds.

3.   Plug the power supply back in to the outlet.

    Restarting the FRITZ!Box takes about 2 minutes. During this time, you cannot access the FRITZ!Box user interface.

After the restart and logging back in to the FRITZ!Box you will be automatically redirected to the "Overview" page of the FRITZ!Box.

25   Update: Updating FRITZ!OS

ⓘ   Always install the latest version of FRITZ!OS on all FRITZ! products in your FRITZ!Box home network. This keeps your FRITZ! products up to date and ensures optimum synchronization of all devices in your home network.

AVM provides regular free FRITZ!OS updates for your FRITZ!Box. FRITZ!OS is the operating system of the FRITZ!Box and controls all functions and settings of your FRITZ!Box. FRITZ!OS updates provide for maximum security in your home network, contain further developments of existing FRITZ!Box functions and often also introduce new features for your FRITZ!Box.

25.1   Updating FRITZ!Box Automatically

With the "Automatic Update" feature you have the option of installing updates automatically whenever a new FRITZ!OS version becomes available. For the "Automatic Update" function you can select among various methods:

Procedure	Description
Notify about new FRITZ!OS versions	The FRITZ!Box indicates that a new version of FRITZ!OS is available on the start page.
	You start the update yourself; see page 163.

Procedure	Description
Notify me about new versions of FRITZ!OS and install necessary updates automatically (recommended)	The FRITZ!Box indicates that a new version of FRITZ!OS is available on the start page. You start the update yourself; see .
	Updates which AVM regards as necessary for continued secure and reliable operation (for instance, security updates) will be installed automatically.
	The FRITZ!Box selects a suitable time for the update, generally at night.
	During the installation all Internet and telephony connections will be interrupted briefly.
Notify me about new versions of FRITZ!OS and install new versions automatically	The FRITZ!Box indicates that a new version of FRITZ!OS is available on the start page.
	Every new version of FRITZ!OS will be installed automatically.
	The FRITZ!Box selects a suitable time for the update, generally at night.
	During the installation all Internet and telephony connections will be interrupted briefly.

Configuring Automatic Update

1. Open the FRITZ!Box user interface.

2. Select the "System /Update " menu and click the "Automatic Update" tab.

3. Select the desired auto-updating option.

4. Click "Automatic Update".

This concludes the configuration of the auto-update feature.

You can also request notification about new updates by e-mail; see Push Services: Using Notification Services from .

25.2   Performing an Update with the Wizard

A wizard is available in the FRITZ!Box user interface to assist you in updating your FRITZ!Box. The wizard checks whether an update of the FRITZ!OS is available for your FRITZ!Box and guides you step by step through installation.

Performing the Update

1. Open the FRITZ!Box user interface.

2. Select "Wizards".

3. Start the "Update" wizard.

   The Wizard checks whether a FRITZ!OS update is available for your FRITZ!Box.

   If the Wizard finds an update, it displays the version number of the new FRITZ!OS. Click the link under the FRITZ!OS version to view information about further developments and new functions contained in the FRITZ!OS update.

   Interrupting the FRITZ!OS update could damage your FRITZ!Box. Do not clear the connection between FRITZ!Box and the computer during a FRITZ!OS update, and do not unplug the power cord.

4. To transfer the FRITZ!OS update to the FRITZ!Box, click "Start Update Now".

   The FRITZ!OS update begins and the Info LED starts flashing.

The FRITZ!OS update is complete when the "Info" LED stops flashing.

25.3 Updating manually

In some cases it is not possible to perform an automatic update, for instance when the FRITZ!Box is not connected to the Internet. Then you have the option of performing an update manually.

Downloading the FRITZ!OS File

Before you can perform a manual update, you must download an up-to-date FRITZ!OS file from the Internet (using your neighbor's or friend's computer, or at an Internet café) and save it on your computer or on a connected storage medium.

1. Enter the address ftp://ftp.avm.de/fritz.box in your web browser.

2. Switch to the folder for your FRITZ!Box model, then to the sub-folder "firmware", and then to the folder named "english".

   The complete model name of your FRITZ!Box is shown in the user interface on the "Overview" page and is also printed on the sticker on the underside of the housing.

3. Download the latest FRITZ!OS file for your FRITZ!Box with the file extension ".image" to the computer.

   The currently installed version of FRITZ!OS is displayed on the "FRITZ!OS File" tab and on the "Overview" page. The version number of the FRITZ!OS you downloaded and saved is included in the name of the "*.image" file. Perform an update only if the downloaded FRITZ!OS is a newer version than the FRITZ!OS currently installed.

Now you can copy the FRITZ!OS file to the computer that is connected to the FRITZ!Box, for instance using a USB flash drive.

Performing a FRITZ!OS Update

1. Open the FRITZ!Box user interface.

2. Enable the advanced view.

3. Select "System / Update / FRITZ!OS File".

4. Click the **"Save Settings"** button to save the current settings of your FRITZ!Box on your computer and save the export file on your computer.

   Using this file you can restore the settings of your FRITZ!Box as needed.

5. Click the **"Browse... button and choose the file with the new FRITZ!OS you already downloaded and saved on your computer."**

   Interrupting the FRITZ!OS update could damage your FRITZ!Box. Do not clear the connection between FRITZ!Box and the computer during a FRITZ!OS update, and do not unplug the power cord.

6. Click the **"Start Update"** button.

   The new FRITZ!OS is transmitted to your FRITZ!Box.

The update is complete when the **"Info"** LED stops flashing.

26 Taking FRITZ!Box Out of Operation

In this chapter you receive tips and recommendations for taking the FRITZ!Box out of operation.

26.1 Deleting User Settings

To delete all individual user settings you've configured in your FRITZ!Box, use the "Load Factory Settings" function. When the factory settings are restored to the FRITZ!Box, all of the settings in the FRITZ!Box are restored to their condition upon delivery.

Restoring the factory settings is recommended if you would like to pass the FRITZ!Box on to another user. By restoring the factory settings you can delete incorrect settings that prevent the FRITZ!Box from functioning properly.

Resetting the FRITZ!Box has the following effects:

- All settings you made in the FRITZ!Box will be deleted.

- The network key of the factory settings will be activated again.

- The IP configuration of the factory settings will be restored.

You have the option of restoring the factory settings using the FRITZ!Box user interface or a telephone connected with the FRITZ!Box. The page 166 section describes how to restore the factory settings with the user interface. How to restore them using a telephone is described in the Loading Factory Settings on page 119 section.

Preparing to Load Factory Settings

Before loading the factory settings of your FRITZ!Box, save your settings.

Saving FRITZ!Box Settings

Before loading the factory settings, save all of the settings you made in your FRITZ!Box to a backup file. With this backup file you can restore your settings to the FRITZ!Box at any time

or load them to another FRITZ!Box. For more information on this, see the section Saving and Restoring Settings from page 158.

Loading Factory Settings

Before loading factory settings, we recommend saving the settings configured on your FRITZ!Box in a backup file; see page 158.

1. In the FRITZ!Box user interface, select the "System / Backup" menu.

2. Select the "Factory Settings" tab.

3. Click the "Load the Factory Settings" button.

The FRITZ!Box is reset to its factory settings. All settings made during operation will be overwritten.

26.2   Uninstalling Supplementary Software

Additional software for the FRITZ!Box is available on the web pages of AVM at en.avm.de/service/downloads.

If you have installed supplementary programs on one or more computers, uninstall this software using the control panel of your Windows operating system.

Uninstalling Programs in Windows 10 and Windows 7

1. Open "Start / Control Panel / Programs".

2. Under "Programs and Features", click "Uninstall a program".

3. Mark the AVM program you want to remove in the list.

4. Click the "Uninstall/Change" button.

The program will be removed.

Uninstalling Programs in Windows 8

1. Press the Windows key 🪟 and the X key at the same time.

   A menu is opened that contains all of the important functions of Windows 8.

2. Click the "Programs and Features" entry.

   The "Uninstall or change a program" list shows all of the programs installed on your computer.

3. Mark the AVM program you want to remove in the list.

4. Click the "Uninstall" button.

The program will be removed.

27 Help in Case of Errors

Here you can find assistance if no DSL connection is established, if the FRITZ!Box cannot be opened, or if errors occur with wireless LAN connections.

For more help, see the AVM Knowledge Base in the Internet: en.avm.de/service

27.1 DSL Connection Not Established

If the "Power / DSL" LED keeps flashing, the FRITZ!Box cannot establish a DSL connection. Make sure the correct DSL variant (annex) is set in your FRITZ!Box.

Setting the DSL Variant (Annex)

1. Contact your Internet service provider to find out whether the DSL variant "Annex A" or "Annex B" is used on your DSL line.

2. Connect a computer to the FRITZ!Box; see .

3. Open the FRITZ!Box user interface.

4. Switch to the advanced view and choose "Internet / DSL Information / Line Settings".

5. Under the "Annex Settings" select the DSL variant used on your DSL line and click "Apply".

The FRITZ!Box restarts and establishes the DSL connection. The connection has been established when the "Power / DSL" LED lights up.

27.2 The User Interface Does Not Open

If the FRITZ!Box user interface cannot be opened, this can have various causes.

Work through the following steps in sequence until the error has been resolved.

Entering http://fritz.box in the Web Browser

Enter http://fritz.box in your web browser instead of
"fritz.box".

Google Chrome, for instance, performs a Google search if the
address of the FRITZ!Box is not known or was entered incom-
pletely.

Restarting the FRITZ!Box

1. Disconnect the FRITZ!Box from the power supply.

2. Wait about five seconds before reconnecting to the pow-
   er supply.

3. Wait until the LEDs "Power / DSL" and "WLAN" (only if
   wireless LAN is switched on) light up.

The FRITZ!Box is ready for operation again.

Clearing the Cache of your Web Browser

If the web browser shows only a blank, white page, empty the
cache:

Firefox

1. Click the "Menu" button and select "History / Clear Re-
   cent History...".

   Or click "History" in the menu bar and select "Clear Re-
   cent History...".

2. In the "Clear Recent History" dialog, select "Everything",
   and under "Details", check only the "Cache" option.

3. Click "Clear Now".

Internet Explorer

1. Click the "Tools" button and select "Internet options".

2. On the "General" tab, click the "Delete... button in the
   "Browsing history" area."

3. Enable the "Temporary Internet files and website files"
   option and click "Delete".

Google Chrome

1. Click the Chrome menu ("Customize and control Google Chrome" button) and select "History / Clear browsing data...".

2. Select "the beginning of time", and below it only the option "Cached images and files".

3. Click "Clear browsing data".

Other Web Browsers

If you use a different web browser, see the Help for your browser for instructions on how to clear the cache.

Checking the Proxy Settings of the Web Browser

If a proxy server is enabled in your web browser, the address of the FRITZ!Box must be entered as an exception. Check your web browser settings.

Firefox

1. Click the orange Firefox button and select "Options / Options".

   Or click "Tools" in the menu bar and select "Options".

2. Select "Advanced / Network".

3. Under "Connection", click the "Settings... button."

4. If the option "Manual proxy configuration:" is enabled, enter http://fritz.box in the "No Proxy for:" field and then click "OK".

   If the manual proxy configuration is not enabled, click "Cancel".

Internet Explorer

1. Click the "Tools" button and select "Internet options".

2. Switch to the "Connections" tab and click the "LAN settings" button.

3. If the "Use a proxy server for your LAN" option is enabled, click "Advanced". Under "Exceptions" enter the address http://fritz.box and click "OK".

   If no proxy server is used, click "Cancel".

Google Chrome

Check whether the use of a proxy server is enabled. If so, enter http://fritz.box as an exception in the proxy server settings.

Google Chrome uses the proxy settings of your operating system (Windows or Mac OS). For more information, go to Google Chrome Help and enter the keyword "network settings".

Other Web Browsers

Check whether the use of a proxy server is enabled. If so, enter http://fritz.box as an exception in the proxy server settings.

For more information on the proxy settings, see the Help for your web browser.

Configuring the Computer's Network Adapter

On your computer, enable the setting "Obtain an IP address automatically" for the network adapter used to connect to the FRITZ!Box. For instructions, see page 131.

Opening the User Interface Using an Emergency IP Address

The FRITZ!Box has an "emergency IP address" (169.254.1.1) at which it can always be reached. You can use this IP address as follows:

1. Connect your computer to the "LAN 2" port of the FRITZ!Box using a LAN cable.

2. If your computer is already connected with the FRITZ!Box over wireless LAN, clear the wireless connection.

3. Make sure that the computer obtains its IP address automatically; see page 131.

4. Clear all other connections between your FRITZ!Box and other network devices.

5. In the web browser, enter the address 169.254.1.1.

6. When the FRITZ!Box user interface is displayed, enable the DHCP server of the FRITZ!Box:

   In the user interface, select "Home Network / Home Network Overview / Network Settings". Click the "IPv4 Addresses" button, enable the option "Enable DHCP server" and click "OK".

27.3 Cannot Establish a Wireless LAN Connection

If you cannot establish a wireless LAN connection between your computer and the FRITZ!Box, this may be due to a variety of causes.

Work through the following steps in sequence until the error has been resolved.

Switching On the Computer's Wireless LAN Adapter

The wireless LAN adapter in your computer must be ready for operation. On many notebooks the built-in wireless LAN adapter can be switched on by pushing a button or entering a key combination.

For more information, see the manual of your computer.

Enabling the Wireless Radio Network of the FRITZ!Box

When the "WLAN" LED is off, press the "WLAN" button on the FRITZ!Box. Hold it down until the "WLAN" begins flashing.

The wireless network is switched on and the "WLAN" LED lights up.

Announcing the Name of the Wireless Radio Network

If the wireless LAN software on your computer cannot find the wireless radio network of the FRITZ!Box, configure the following setting in the FRITZ!Box:

1. Connect a computer to the FRITZ!Box with a network cable; see page 28.

2. Open the FRITZ!Box user interface.

3. Select "WLAN / Radio Network".

4. Enable the option "Name of the wireless radio network visible".

5. Click "Apply".

6. Remove the network cable and establish a connection via wireless LAN.

Entering the Correct Network Key

If you establish the wireless connection manually, enter the correct network key, which is found in the user interface of your FRITZ!Box:

1. Connect a computer to the FRITZ!Box with a network cable; see page 28.

2. Open the FRITZ!Box user interface.

3. Select "WLAN / Security".

4. Take note of the network key or click "Apply" and print out the wireless LAN security settings.

27.4   Wireless LAN Connection Interrupted

If the wireless LAN connection between your computer and the FRITZ!Box is disrupted, this may be due to a variety of causes. Work through the following steps in sequence until the error has been resolved.

Positioning the FRITZ!Box and Wireless Devices Correctly

Often all that is needed is to position the FRITZ!Box and wireless devices in different locations to improve the wireless LAN connection:

* Do not set up the FRITZ!Box in the corner of a room.

* Do not set up the FRITZ!Box directly next to or beneath an obstacle or a metal object (like a cabinet or radiator).

* Position the FRITZ!Box and your wireless devices so that there are as few obstacles between them as possible.

Configuring Automatic Radio Channel Selection

Configure automatic selection of the radio channel in the FRITZ!Box. Then the FRITZ!Box will automatically select a radio channel with as little interference as possible.

1. Open the FRITZ!Box user interface.

2. Select "WLAN / Radio Channel".

3. Enable the option "Set radio channel settings automatically (recommended)".

4. Click "Apply".

28 Technical Specifications

Facts worth knowing: Here you will find comprehensive technical data on your FRITZ!Box 7369.

28.1 Ports and Interfaces

- DSL/telephone port
    - VDSL/ADSL modem for use with ADSL/ADSL2/ADSL2+ compliant with ITU G.992.1, ITU G.992.3, ITU G.992.5 (Annex A, B J or M) or VDSL2 compliant with ITU G.993.2
    - telephone port for connecting to the analog network
- One a/b port with a RJ11 socket for connecting analog terminal devices
- DECT Base Station
- Four LAN ports via RJ45 sockets (standard Ethernet, 10/100/1000 Base-T)
- Two USB host controllers (USB version 2.0)
- Wireless access point with support for wireless networks in the 2.4-GHz frequency band
    - IEEE 802.11b—11 Mbit/s
    - IEEE 802.11g—54 Mbit/s
    - IEEE 802.11n—300 Mbit/s

28.2 Router Functions

- Router
- DHCP server
- Firewall with IP masquerading/NAT
- IPv4 and IPv6
- Parental controls and filter lists
- Port Sharing

- Dynamic DNS
- VPN

28.3   User Interface and Display

- Configuration and status messages via a web browser on a connected computer
- five LEDs indicate the condition of the device

28.4   Tones

- Busy signal: 500 ms tone, 500 ms pause, +/− 20 ms
- Ring tone: 1 s tone, 4 s pause, +/− 100 ms

28.5   Device Properties

- Dimensions (W x D x H): circa 226 x 47 x 160 mm
- FRITZ!OS can be updated
- Conforms to CE standards
- Ambient conditions
    - operating temperature: 0 °C–+40 °C
    - storage temperature: -20 °C–+70 °C
    - relative humidity (operation): 10%–90%
    - relative humidity (idle): 5%–95%
- Supply voltage: 230 V / 50 Hz
- Maximum power consumption: 22 W
- Average power consumption: 8 W—11 W

    The average power consumption was determined at room temperature (23 °C to 27 °C) with the following load:

    - DSL connection active
    - wireless LAN on; no devices registered via wireless LAN

- DECT on; one telephone registered via DECT; no active calls

- one network device connected to a LAN port; no data transfer; other LAN ports not in use

28.6 Cables

Network Cable (yellow)

Use

The network cable is used to connect computers and network devices to the FRITZ!Box 7369.

- AVM recommends using a network cable no more than 100 meters long.

- Additional network cable is required if you would like to use all of the FRITZ!Box 7369 network ports.

Extension

You can extend one or both ends of the network cable. You will need the following components to extend the cable:

- Standard CAT-5 network cable

    - When components of a category smaller than Cat 5 are used, reduced transmission rates may result.

    - You can use both straight cables and crosslink cables.

- 1 standard RJ45 CAT-5 double coupling with a 1:1 pinout

All components are available from specialized vendors.

Replacement

The network cable is a standard cable.

- As a replacement, use a standard Cat-5 network cable.

Replacement cable is available from specialized vendors.

29 Customer Service

Be it further product documentation, frequently asked questions, tips or support—this chapter presents information on all important service topics.

29.1 FRITZ!Box Help

In the FRITZ!Box user interface you can open the detailed Help by clicking the "question mark" icon. The Help presents descriptions and instructions on all settings and functions of your FRITZ!Box.

29.2 Information in the Internet

On its web site AVM presents comprehensive information on your AVM product.

AVM Service

The Service area is the portal for all product-specific services from AVM: manuals, downloads and support requests. In the Service area you can also receive comprehensive information and useful tips on configuring and operating your devices.

en.avm.de/service/

Videos on the FRITZ!Box

Videos on many of the FRITZ!Box functions are available, showing animated demonstrations of how to set up the individual functions. The videos can be viewed at the following address:

en.avm.de/service/fritz-clips/english-fritz-clips/

Newsletter

The German-language newsletter keeps you up to date on current topics at AVM. The newsletter also presents tips & tricks on everything that has to do with AVM products. You can subscribe to the AVM newsletter at the following address:

avm.de/newsletter

29.3   Feedback on FRITZ!Box

In various places in the user interface, the FRITZ!Box offers you the opportunity to send concrete feedback to AVM. Your feedback helps us to continually improve the FRITZ!Box.

When you submit feedback, only the technical data and no personal data are transmitted to AVM. These data are used for the exclusive purpose of product improvement. A corresponding message appears in the Event Log, stating that the feedback was sent to AVM.

Automatically Sending Error Reports to AVM

In the case of serious errors, this service generates a report on the problem that occurred and automatically sends this error report to AVM. The error report helps improve the stability of FRITZ!OS.

The feature for automatically sending error reports is located on the "Contents / AVM Services" page of the FRITZ!Box user interface.

Evaluating the DSL Connection

On the "Internet / DSL Information / Feedback" page you can evaluate your DSL connection. This makes it possible to optimize your DSL performance with upcoming FRITZ!OS updates.

Evaluating the Wireless LAN Connection

On the "WLAN / Radio Network / Known Wireless LAN Devices / Feedback" page you can evaluate your satisfaction with the wireless LAN connection between the FRITZ!Box and the wireless device. This information helps AVM optimize the wireless LAN properties of the FRITZ!Box.

Evaluating the Voice Quality of Internet Calls

In the advanced view of the FRITZ!Box (see page 37), the "Telephony / Telephone Numbers / Voice Transmission" page offers you the opportunity to evaluate the quality of the Internet call. Your evaluation will help us continue to improve the quality of voice transmission in Internet calls made over the FRITZ!Box.

The contents of the call and numbers participating will not be transmitted to AVM.

29.4   Assistance from the Support Team

If you have problems with your FRITZ!Box, proceed as follows:

1.   If you have questions about starting operation of your FRITZ!Box, please consult the following chapters:

   –   Before You Connect the FRITZ!Box from page 19

   –   Connecting the FRITZ!Box from page 23

   –   Connecting a Computer with a Network Cable from page 28

   –   Connecting Devices with the FRITZ!Box over Wireless LAN from page 31

2.   If you have any problems, for instance in establishing connections, read the section Help in Case of Errors from page 169.

3.   Search for a solution in the AVM Knowledge Base.

   en.avm.de/service

   This site contains answers to questions frequently posed to our Support team.

Support by e-mail

You can send us an English-language e-mail request at any time using the "Service" area of our website. You can reach the service area at en.avm.de/service/support-request/your-support-request.

1.   Select the product group and your product for which you need support.

   You will receive a selection of FAQs.

2.   If you need more help, click the "Submit support request" link to open the e-mail support form.

3. Fill out the form and send it to AVM by clicking the "Submit support request" button.

Our Support team will respond by e-mail as quickly as possible.

Declaration of CE Conformity

AVM, declares herewith that the device is compliant with the basic requirements and the relevant rules in directives 2014/53/EU, 2009/125/EC and 2011/65/EU.

The long version of the declaration of CE conformity is available at en.avm.de/ce.

Disposal Information

In accordance with European regulations, FRITZ!Box 7369, as well as all devices and electronic components contained in the package, may not be disposed with household waste.

After use, please dispose of FRITZ!Box 7369 and all electronic components and devices included with delivery at a collection point in your local community for the disposal of electric and electronic appliances.
